GE Andy.. Well , I agree with you. Don't think Rick puts Scamp up as high as we do. The last couple upgrades were showing promise and it was well ahead of its time. Guess he has it to thank for the huge success of Winmor. Really curious to give V4 a hefty shot.

Dave/All

I have been testing and working on Help. I plan to release the first ALPHA version tomorrow but with the ARQ mode deactivated as it still needs more tedious testing and work. FEC and Monitor modes seem to work pretty well at least on the HF simulator.

Once Vic gets back from his trip I'll have to spend some additional time on RMS Express/WINMOR so there won't be a lot of updates right away.

Also until we get the code and the install basically stable I won't enable the auto updates....that can cause more problems in the beginning. If I post an update it will be a full install requiring a uninstall reinstall (but all settings will be retained).

Good Idea Dave,

I would suggest at least two on each of the popular HF bands. Since the BW is only 200 Hz we should be able to find a place. I would suggest at least 500 Hz separation for now perhaps more.

Also while V4 will work either USB or LSB I suggest we keep life simple and all work USB and use Dial frequencies. The actual center of the RF spectrum will be 1523 Hz above the USB dial. There is a simple mini Log feature that will allow you to easily enter/save/edit a dial freq and set the radio to that with one mouse click (if you are using radio control).

14. V4 PPT, and CF Notation for use with older rigs LSB and USB

Yahoo group: V4Protocol
Date: 2010-12-02 23:55:22 UTC
From: la7um
Topic: 14 Message: 14

Rick, could you please put the PPT presentations in the files section here?. I have seen it somewhere earlier, but don't remember where.

Protocol spec looking very tempting and solid for an amateurs eye.
A lot of similarities from the strongest/slowest elements from WINMOR TNC implemented.
Even UTF-8 for the scandinaviens and other EU "umlauters".

This mode may "work its way through the mud like a nail and hammer". And Really narrow band 250hz CW filters may work I presume.

But now we maybe might be able to use older rigs as well with narrow filtering only centerfreq 2200hz? since LSB and USB is choosable.
Do we need to invert mark and space, or is it universal like P1 an P2?

Maybe CF notation would be usable for this mode. To keep Brains working?

Looking forward.
At the same time your RMS WINMOR up one grade to 1.0.17.0
I, and some others I know might really be a fan.

Hat's off.

I'm guessing we in EU have to find our own waterholes for testing, after the registration page on ARSFI is running.

Now we're getting input, I think 7060 is QRP in Canada, (I just found out.) Well we used to use 7083 or 7077 but there are a couple of Winmor RMS stations there now.... What about 7073 or 7075?? I know the beacon's are on 14.100 so what about 14075?? that's above PSK folks at 14070 and below the RTTY folks. Almost forgot don't want to interfere with the Freq's Bonnie owns either for ALE.

Are you folks forgetting about the Pactor station frequencies as well?

It is going to be fun trying to shoehorn a spot for yet another mode - Pactor, Winmor, V4, plus ALL of the other digital modes in prime spectrum, AND the consideration of crossing international borders with different regulations / mode assignments.

To keep the hard won respect of existing WL2K operations, we might want to take a serious and detailed look at what may or may not be available. All the WL2K station operation is a matter of record. Adding the other 'favourite frequencies' to those lists shouldn't be too difficult.

After that - pick what is left for V4. It wasn't that long ago that the WDT was taking a lot of flac for the spectrum that Pactor was operating in. Then we added Winmor. Wonder what popularity contest V4 will win for WL2K.

Not kicking on anybody or anything, but lets do this intelligently, not just bounce numbers around.

GE Michael,

I'm all for picking a frequency "intelligently". Anybody got a data base with all the "claimed" frequencies per mode in it? While you are at it, throw in the 'special interest' frequencies like for QRP and all the various nets. What's left?? NOT MUCH!! But, if we don't pick a "center of interest" frequency, we won't be able to find each other.

The difference between V4 and Pactor or Winmor is that both Pactor and Winmor require fixed frequencies for the RMS stations or otherwise they are pretty much useless. V4 does not require fixed frequencies any more than any other keyboard to keyboard mode does. Therefore V4 only needs some "center of interest" frequencies. That's just some place where stations wishing to make V4 contacts can look around to find other V4 stations rather than having to scan the entire band to look for another V4 station. VFOs will work wonderfully just like with any other KB to KB.

Somebody call it on this one.

Dave K3GAU

From: John Hirth
Topic: 7 Message: 22

For quite a few years new keyboard modes on 20m have been comfortable in the area above PSK-31 and below the old RTTY area. As long as we keep our dials between about 14.073 and 14.077 we should be OK.

If we stay near the traditional keyboard operating areas we're more likely to drum up some interest from the curious who monitor that area. Keyboarders are used to tuning around, so there may not be a need for us to specify fixed operating frequencies, just a small area to search or call CQ.

Sorry I can't really comment on the other bands, as 20 I where I spend most of my digital time.

From: va3lki
Topic: 13 Message: 23

Hi Dave

You emphasize my concerns very well.

John - W2KI has a reasonable suggestion with potential for growth in the V4 mode. I too don't know if it will apply to the other bands, but sticking in the same area as the other keyboard operations are, does make some sense. I suspect there may be a comfortable niche there, and the 'battles for spectrum' already fought, won, or lost.

If V4 is really just another keyboard method of doing the same thing in a little different way, then should it not still play in the keyboard sandbox? A bit like faster modes of PSK staying within the PSK area, or CW at 25, 35 and 50 wpm all playing nice together.

GM All,

I like John's suggestion. The 'north' ends (high frequency side) of the keyboard to keyboard areas of the bands sounds like a plan to me. The only question may be on 40 meters where there seems to be two KB to KB areas, one from 7035 and up and the other 7070 and up.

From: Jeff - WA4ZKO
Topic: 13 Message: 26

Unless someone wants to put together a website where WINMOR K2K ops can hook up, pick a time, pick a freq, etc etc....some general hangout spots on the dial are a good idea.

I suggest staying fairly close to the usual 80m/40m WINMOR hotspots of 3.573/7.077 USB (dial). Whether or not those choices were the best could be debated till the cows go home, but momentum is what it is.

Doubt there is a perfect solution, especially on our very crowded (at best) lower bands. Bottom line is we have lots of digital modes trying to share some small chunks of HF spectrum.

Also consider a 30m hangout spot. Nice thing about 30 is it doesn't turn into a total QRM zoo during digital/cw contests.

May I suggest that you consider use of the "sked" page to coordinate a frequency and chat while attempting you first few V4 QSOs. This worked well when Winmor was first born.

http://www.obrienweb.com/sked click on the digitalradio tab.

How about skeds via K3UK's sked page, that worked very good during winmor beta-test:
http://www.obriensweb.com/sked/

I fully agree if V4 is merely intended for K2K (keyboard to keyboard) use. Then a center of activity and eventual skeds via http://www.obriensweb.com/sked/ or any other suggested sked page is sufficient it seems to me.

But it begs the question is V4 merely intended for K2K use, since it originates from the WL2K team? Or is it (also) going to fit in the Wl2K set of programs in the future (that is my primary focus of interest)? In other words: Is the K2K alpha test a preliminary for the ARQ V4 Mode?

Hi Dave

What about using 14.101, 14.103, 14.113, 14.115 and take back the ROS freq?

By the way, take a look at this page:
http://www.bandplans.com/index.php?band=All
It is not much playground left..

Marc,

There is no point speculating on these things....It should be fairly obvious from the performance figures and the V4 and V4Chat paper that V4 is intended strictly as a keyboard mode. It is limited to text, doesn't use compression and is slower and less adaptive (but more robust and narrower) than WINMOR ....all by design. It is designed to do keyboard to keyboard at normal typing speeds with fairly good "slickness" (RX to TX turn over) and be more robust than modes like PSK (especially in poor multipath). It is the result of many requests and several vain attempts to use WINMOR for keyboarding.

There are good reasons why modes are (or should be) designed for specific purposes. With DSP it is much easier to design and optimize a mode that does a specific function well. When you try and make one thing fit all applications (Keyboard, files, messages, HF, VHF, wideband, narrow band, etc) you end up with a Camel (aka the Horse designed by committee!)

There is absolutely no logic that would suggest that V4 compete with WINMOR or be morphed to have WINMOR capability. They do 2 different things just like CW and SSB voice.

The theory and early testing on the simulator suggests that V4 should fit the keyboarder's requirements well though of course it will take time and work to optimize this.

This isn't operable with WL2K. It's an ARQ keyboard comms application per se.
How much spectrum does this take up compared to RTTY, PSK, etc?

RTTY and PSK aren't compatible simply for the fact that RTTY clobbers PSK.
How well will WINMOR play with RTTY? PSK? If it's no winder than PSK, I
don't see why it can't go anywhere it will fit on a not-to-interfere basis. NO
difference than we do now just out of courtesy for our other modes.

I guess I'm a bit reluctant to entertain a discussion about having to find a
separate home for the operations when we don't have to, IMHO. There's no
channel list to reference

Why can't we just pick a quiet frequency (ies) and test (call CQ WINMOR, set up
a sked referencing CF, etc)? We're not testing for WL2K application are we?
I thought this was totally applicable to normal QSO comms but with the advantage
of error-free copy by virtue of ARQ.

Seems to me it's no different than RTTY or my PacTOR I ops on 14111 CF.
Let's just test the capability to the max, have fun with it, and try not to bust anyone's
chops 'cause we weren't checking the freqs like we should.

GM All,

I like John's suggestion. The 'north' ends (high frequency side) of the keyboard to
keyboard areas of the bands sounds like a plan to me. The only question may be on 40 meters
where there seems to be two KB to KB areas, one from 7035 and up and the other 7070 and up.

Hi Rick,

TNX 4 ur reply. And I already guessed that since it was asked several times to include a K2K facility for winmor. So now there is V4 for those.

But I sure hope that V4 is not going to take too much development time for winmor, since winmor still has some hick-ups every now and then. But you also said you were going to focus again on winmor in the coming time. So PSE have a look at the "memory issue" (i.e. memory not released/variables not reset after a connect)

"What the percentages of operation for SSB vs. digital/cw in LA land?"

Hi David

The only band that is regulated by government is 600m (493-510Khz).
Only CW A1A is allowed.

The Norwegian regulation translated with google:

http://translate.google.com/translate?js=n&prev=_t&hl=en&ie=UTF-8&layout=2&eotf=1&sl=auto&tl=en&u=http%3A%2F%2Fwww.lovdata.no%2Ffor%2Fsf%2Fsd%2Ftd-20091105-1340-0.html

42. V4 in prespective of Band With usage and manned stations.

Yahoo group: V4Protocol
Date: 2010-12-04 15:26:29 UTC
From: la7um
Topic: 42 Message: 42

Hi all. Rick an V4 project is really into some very positive issues.
Talking K2K: P3 abt 2400hz and Winm 1600hz would be a qrm idling machine. A huge waste of BW.
Even Winm 500hz (abt 450 hz) also needing kind of a cars (B)road Band quality.

Pactor 1,2 Gtor, worked very well within the Icom 350hz special narrow band filters, IF!!! you tuned right on target. I have done that with great success over and over again. Years ago.

What is V4 offering: 1. Solid FEC-protected broadcast. 2 Even ARQ error free mode K2K, including canned Brag files, standard 127 ASCII and by chose a full UTF-8 Key for for at least the rest of EU set, maybe more, I don't know.

All this within a narrow "forest path" foot print of 200hz, NOT a Motor Way BW for file transfers, but a posibillity to commuinicate as quick as can be expected on a key board.
Also changing from ISS to IRS in a quick, or "slick" way, as Rick is formulating it.
This mode may hopefully work within the narrowest 250hz CW filters on all rigs, old or new. USB AND!!! LSB can be used, so those filters can be invoked.
Those filtere NEVER WORKED with amtor or pactor for me, only cw. Never tried PSK31 with them.

Please let us get information on this issue also along this testing lane.

YES. This is quite something we all really should look forward to.

AND as MANNED STATIONS there are a lot of wider spectrums available than the unmaned only WL2K have to their disposal.

But I concur with MARC. The WINMOR LEFTOVER UNSOLVED ISSSUES ARE NOT FORGOTTEN by some of the server drifters. Hi.

73. And again GOOD LUCK, (with both)
La7um Finn

All,

OK this is the initial ALPHA version....user beware! I have tested it on 4 computers (XP, Vista, Win 7 (32 and 64 bit). You will need .NET 3.5 (same as for WINMOR).
ARQ mode is currently disabled...needs more testing on the simulator but is close...maybe next week.

What feedback I need now is:
1. Install problems (missing files etc...Should be OK). Should also install a V4Chat Icon on the desktop and in the programs list.
2. License issues. This uses support files for IPWorks controls and Direct X. It looks like theses are all OK but....
3. Help. Basic help files exists for both the V4Chat and the helper application V4 TNC. You should read those (I know few do...but try before asking too many questions!)
4. This uses TCP connections so your Windows defender or Firewall or router has to let those through or the V4 TNC won't work. Similar to WINMOR but the port of course is different.
5. If you have WINMOR working the same settings (drive level, Sound card, radio control, PTT etc) should all work.
6. Try an over the air contact or a FEC Loop test (see the help) to get started.
7. There are many internal parameters that set the thresholds for detecting the signal and proper demodulation. These seem to work fairly well in the simulator but will need tweaking on weak signals over the air. I'm not too concerned about them at this initial launch.

Please DO NOT start asking for features, font changes, cosmetic changes etc UNTIL we get the basic install working and some useable FEC over the air sessions working.
If you have trouble with radio control or PTT control be SURE and completely define your setup (radio make & model, method of hookup, sound card interface, radio keying) and accurately describe what does or does not happen.

Feedback needs to be accurate to be helpful. "It crashes" or "Its broken" won't help and won't be answered!

Good luck,

Rick KN6KB

GM Steiner,

Thanks. Love the simplicity of your rules. I wonder how many of the bureaucrats we could fire in the FCC and our government in general if we had such simple rules? :-)

What I was really interested in was the number or percentage of LA hams that normally operate SSB vs those that normally operate the digital modes.

Another question I would like to ask is, since your bands are wide open are there any "gentlemen's agreements", etc. as to where to operate SSB or where to operate digital modes, etc.?? The only 'open' HF band we have is 160 meters and by and large it works reasonably well.

Dave K3GAU

>>> Steinar Aanesland 12/04/10 8:41 AM >>>
"What the percentages of operation for SSB vs. digital/cw in LA land?"

Hi David

The only band that is regulated by government is 600m (493-510Khz).
Only CW A1A is allowed.

The Norwegian regulation translated with google:

http://translate.google.com/translate?js=n&prev=_t&hl=en&ie=UTF-8&layout=2&eotf=1&sl=auto&tl=en&u=http%3A%2F%2Fwww.lovdata.no%2Ffor%2Fsf%2Fsd%2Ftd-20091105-1340-0.html

From: Fred
Topic: 47 Message: 47

Just completed a successful test between two of my stations. I plan to get my MARS guys involved for further testing on our South Carolina net.
This will work well on our designated frequencies. I am hoping that multi-path problems suffered by other modes are a thing of the past.

Thanks Rick

Good Fred,

For really weak signal or gnarly multi path the ARQ mode will be better...It keeps on banging (up to 10 repeats) to get the frames through. I should have that working next week. At least the installs are worked (I had lots of problems with that over the past 4 days!)

I had one partial contact with excellent constellations but he had trouble hearing me....My 20 meter ant was showing lots of SWR so???

David. There is kind of gentlemans agreements. The NRRL do administer "on behalf of NPT" while looking at IARU reg 1 recommendations.
Most of us, but not all do respect this recommendations.

We are "self-ruling ourselves". And traditionally there have for lots of years been a very good cooperation between the NRRL and NPT.

But my personal oppinion is that digital modes has been kind of a "stepchild". This gradually is getting better.
In reality we here of course are a part of EUROPE.

But NPT (in cooperaton with NRRL has given us VFO possibilites on 60m. Secondary Basis. That is quite something.)

CW, and SSB RULES. and during tests the beloved RTTY DOUBLE RULES THE WHOLE SPECTRUM running the 1000W.

Steinar is good at calculations...I leave the statistics to him, hi.

************** JIT Debugging **************
To enable just-in-time (JIT) debugging, the .config file for this
application or computer (machine.config) must have the
jitDebugging value set in the system.windows.forms section.
The application must also be compiled with debugging
enabled.

For example:

<configuration>
<system.windows.forms jitDebugging="true" />
</configuration>

When JIT debugging is enabled, any unhandled exception
will be sent to the JIT debugger registered on the computer
rather than be handled by this dialog box.

All,

Those having PTT problems....YOU MUST explain which of the four possible PTT methods you are using and your setup.

1) PTT via VOX operated relay in the sound card interface (e.g. Signal Link)
2) PTT via VOX using the transmitter's built in VOX tripped from the audio
3) PTT via a dedicated serial control port using the RTS or DTR signals (this might be through the sound card interface)
4) PTT via a serial command to the radio (supported on some radios) This is the same port that does radio frequency and mode control.

I didn't have the facilities here to check all these out.

Rick - Using a Kenwood TS-440s with the IF-232C interface. According to the Help you must use a speed of at least 4800 baud. That is the maximum speed that the TS-440s / IF-232C can support. 4800 baud is available as a speed setting but I get an error stating "Radio control port must be greater than 4800 for command PTT.

Thanks Mike KB0FX

Are you controlling using a separate PTT serial port or the radio via a PTT command? Can you send me your V4Chat.ini file and I'll take a look. Send it directly to rmuethingATcfl.rr.com

I have a Flex 3000 and I'm sorry for throwing a complicated setup to the group so early in the V4 Chat life.

Same setup as RMS Express. I'm using Virtual Audio Cable which is working, at least I'm seeing the waterfall and get a green TNC.

For PTT and Radio Control I'm using com0com which is working in RMS Express. Com 6 which translates to Com 16 for control and Com 7 which translate to Com 17 for PTT. RTS and DTR selected with 56K buad. I selected Flex for the radio. I don't see any errors in the logs.

No PTT in two tone test or transmitting text.

I tried BOTH options, using PTT radio command AND PTT via serial port.

I'll send the INI file

Topic: 64 Message: 65

I just installed and gave it a quick test without the transmitter on. PC is Win XP pro.
No issues on install.
PTT with SignaLink functions fine.
Same error you got when highlighting and deleting text in the transmit window. Could continue without issue. I'm used to Fldigi so I first found myself right clicking to find the "Clear" option. HI HI

Will probably have a chance to give it a real test later today or tomorrow. Currently putting up Christmas decorations before the "wintry mix" hits us.

Ron,
I am not going to try and tackle this for the flex until we get it fixed for the other radios. I think I picked up an old rev of the radio control class but it will take some digging to find out the real problem.

Hi Rick,

Yup, I'm having the same problem as Andy.
My PTT setup is (which works for RMS/Winmor).
Dedicated COM port (COM6) RTS. I built the interface for Winmor.
Its not needed for MixW which uses the CAT input to the FT-920.

Topic: 75 Message: 75

Because of unfamiliarity, my end of the qso was disjointed. I had the tendency to hit the "Enter" key when I wanted to go to the next line and ended up sending disjointed text. KB0FX was running 5 watts into a Carolina Windom and I ran 50 watts into my 135 ft. long Off-centre-fed dipole.There was qsb on the received signal and gaps in printing received signal.
Result was not too bad for a first effort.

73, Deme, VE7CRT.

76. Unhandled exception

Yahoo group: V4Protocol
Date: 2010-12-04 19:57:56 UTC
From: w2ki
Topic: 76 Message: 76

Rick,

After I typed a few characters into the buffer to transmit and then backspaced to the beginning I got the following Unhandled Exception.

Length cannot be less than zero.
Parameter name: length.

(Win XP Pro)
John W2KI

Debugging info:

See the end of this message for details on invoking
just-in-time (JIT) debugging instead of this dialog box.

************** JIT Debugging **************
To enable just-in-time (JIT) debugging, the .config file for this
application or computer (machine.config) must have the
jitDebugging value set in the system.windows.forms section.
The application must also be compiled with debugging
enabled.

For example:

<configuration>
<system.windows.forms jitDebugging="true" />
</configuration>

When JIT debugging is enabled, any unhandled exception
will be sent to the JIT debugger registered on the computer
rather than be handled by this dialog box.
```

Deme - I am running about 25 watts. I had great copy on you. I believe the intention is to use V4Chat like text messaging on a cellphone meaning short messages back and forth. The challenge is to not transmit on top of each other when using FEC mode. It should also be possible to have a round table chat in FEC mode but everyone needs to take their turn. Hi Hi. I like the new mode already! Thanks for the first QSO! 73's Mike KB0FX.

Hi Deme,

I copied you calling NC5O (I think that was the call) at 2000 UTC on 14108.3Mhz. Looked good. I'm using an FT-920 and OCF dipole at about 25 feet.
I'm having PTT problems so I couldn't respond. Rick is working the PTT problems.

Because of unfamiliarity, my end of the qso was disjointed. I had the tendency to hit the "Enter" key when I wanted to go to the next line and ended up sending disjointed text. KB0FX was running 5 watts into a Carolina Windom and I ran 50 watts into my 135 ft. long Off-centre-fed dipole.There was qsb on the received signal and gaps in printing received signal.
Result was not too bad for a first effort.

73, Deme, VE7CRT.

81. Double-Mor

Yahoo group: V4Protocol
Date: 2010-12-04 20:34:21 UTC
From: Andy obrien
Topic: 81 Message: 81

It is probably not what Rick wanted to hear, but I have configured RMS Winmor and the alpha version of V4 Protocol to run simultaneously on my PC and , partially, on my rig. So, wherever my RMS Server is, I have V4 ready and can switch to FEC V4 mode if needed (I just click my mouse on my audio routing software to facilitate VOX for V4 at the moment). So, most of the evening I will be on 7077.1 USB (dial), check the RMS Status site. for my frequencies

Andy K3UK

To Fred w1wyc>
Thanks for the info Fred. I heard NC5O sending 'testing' or some such thing and I called him. No response from him.
Lots to learn about this new mode!
73, Deme VE7CRT.

Yes I found that too. For now you can't hit the backspace if there is no text behind the cursor. I should have that fixed on the next rev.

Note once you hit return all the data after the prior return is sent. Data is not sent (into the output buffer) until a return is sent.

Yes I am aware of the possibility of doubling...That can be fixed or at least reduced possibility using a random minimum hold off delay (holds of so many ms after the channel goes clear). Those are finer points we'll get to.

I'm just happy right now it installed OK and at least some (with VOX) are having some success. These initial bugs will be pretty easy to squash.

Deme - I am running about 25 watts. I had great copy on you. I believe the intention is to use V4Chat like text messaging on a cellphone meaning short messages back and forth. The challenge is to not transmit on top of each other when using FEC mode. It should also be possible to have a round table chat in FEC mode but everyone needs to take their turn. Hi Hi. I like the new mode already! Thanks for the first QSO! 73's Mike KB0FX.

88. Copy call to log

Yahoo group: V4Protocol
Date: 2010-12-04 21:15:11 UTC
From: Russell Blair
Topic: 88 Message: 88

From the recivie window tag the call and do a (Shift-C) and then in the log blank location do a right click to bring up the log entry and put the call in the call location with a (Shift-V) that will log the call and the date & time and then you can add the rest.
It works for me .

We downloaded and installed the software. Got a Sound ard TNC & waterfall. Put that in hide and have a screen V4 Chat Ver 0110. We set this in the HAM mode only. If I knew a freq to go to, whats next? We have not EVER mess with the keyboard, other than pactor. You guys mention typing at 50-60 wpm, your kidding. Tried the CW ID thought it might xmitt a signal. It didn't, but we heard the id and also the tone test. Our interface is rigblaster plus. Will that be an issue? Whats freqs are used. We set this up as we did RMS Winmor, that works. Please give me some guide lines like "V 4 for Dummies". 73 Ed WD9DVA

90. Clicking on contact entry changes IC-7000 filter selection

Yahoo group: V4Protocol
Date: 2010-12-04 21:35:07 UTC
From: w2ki
Topic: 90 Message: 90

Rick,

Another small one for far down the list.

V4Chat 0.1.1.0

Radio: Icom IC-7000 with filter SSB-1 selected (in my case 500Hz).
Click on an entry in the contacts list and in addition to the radio's frequency being changed to that listed in the entry, the filter selection gets changed to SSB-2 (and whatever bandwidth you've set for that filter).

Same occurs if you have SSB-3 (typically wide) set and you click on a contact entry. Filter changes to SSB-2. If you have previously selected SSB-2 on the radio and click a list entry the filter is not changed.

I haven't made up my mind how useful the forced frequency change will be, but please don't change my filter selection.

Thanks.
73, John W2KI

Ed, start with the assumption you are setting things up correctly BUT PTT is not working for most of us. First, change the mode to "FEC", set your rig to VOX, then send the CW ID. If that goes out to the world, then type a CQ message in the lower-right hand window, hit enter and it will send. To get fancy, click on USER FILE and create a small test CW message as a .txt file or even a small brag file. That way, you can at least send CQ without having to type it each time.

105. Rick hits another home run!

Yahoo group: V4Protocol
Date: 2010-12-04 23:34:48 UTC
From: Kent & Shirley
Topic: 105 Message: 105

Congratulations Rick this is way too cool! I had my first QSO within minutes of installing! This prog gave me an old feeling of once again being in control of things like I haven't experienced since directly connecting to different people all over the world using Packet on HF back in the 1980s! Just a marvelous feeling to have the freedom to move around the band and catch people where they are. Not a bit like the confines of psk31 ops!
Observations: 1. Easy install. My machine on Win 7 32-bit, even handled a buggered-up previous install of AVG that was still hanging. Despite the conflict I was eventually directed to restart and V4 went on slicker than snuff despite the conflict.
2. Nice help files!
3. No PTT for my Yaesu FT2000d yet, but it took about 10 seconds to turn on VOX and start a QSO. (I'm using dedicated com 1 set at 38.4 with both RTS and DTR on.) Com 5 is similarly set for rig control. I could bring up RMS Express and it worked just fine, as always, same setup.
4. Some keys like backspace returned an unhandled exception as others have already described.
5. No firewall problems.
6. I was amazed how I could shoe-horn myself between two giant piccolo playoffs near 14.072 and still get through. Kind of cool to be able to position your own waterfall and fine tune it to clear the QRM and be able to transmit/receive. If people can get used to making fine adjustments to their frequency to follow another station as he gently adjusts his transmit freek to avoid (QRM) as opposed to religiously sticking exactly to a Winlink node's input freek, for example, we could all find lots of places to work on any band, and have added flexibility to still be seen. I love not being stuck to any specific freek! Anywhere in the keyboard area, that's clear, should be a good place to operate. I don't advocate being tied to a certain place like all the PSK-ers are!
End of my vote---73 de Kent ad7hk--and congrats & thanks to Rick again for doing a super job!

Hi Mike,
You were my first qso also.
The only other digital keyboard mode I know is PSK. I wonder if the intent and format of V4 Chat will be similar?
The immediate question I have is: How does one erase the RX or the TX window without exiting the program? Am I missing something or does that facility exist at all at this stage?
73 Deme VE7CRT.

In Rx window.- Highlight test to be erased then hit the Delete key on keyboard.
In Tx window.- Same as above but get 'Unhandled Exception' message. Click on 'Continue'

Rick,

I have no idea how but the PTT just started to work. You not only have a great program but it's magic :-)

I was on 7080 just playing around and waiting to hear a qso when I hit enter and I transmitted. Russ, NC5O, was on frequency and we chatted. Very cool and I'm not shutting off the computer so I don't loose the settings.

Hello Al. No, and I never could get the VOX to work with my 450. I made a couple contacts, one good one with NC5O and a partial with WA7BRL as the band was folding. I had to resort to the 'ancient' way of manually invoking the SEND button till the transmission was finished. Will work more with it later..

John,

Did you see my earlier post. I have a Flex 3000 and I couldn't get the PTT to work. I was sitting on 7080 waiting to copy a QSO and I was looking through various functions, like user files and setting up macros when all of a sudden it started to transmit. I then had a QSO with NC5O with PTT functions and radio control functions and I have no idea why it started to work. I am using com0com for radio control and ptt functions and VAC for sound. Keep playing maybe your 5000a will start to work :-)

Les,

Did you see my previous email. PTT started to work and I don't know why. I was just playing around listening to monitor QSOs and I hit enter and the PTT came on and I transmitted what I had in the buffer. Then I had a QSO with NC5O.

I'm not sure if I'm loosing my mind but I think I know how I got the PTT working. Maybe somebody else can verify this.

When I first start V4Chat, after I click FEC mode, I can't send any text that I type in the transmit buffer because the PTT doesn't work.

If I copy and paste text in the tranmit buffer and hit enter the PTT is activated for that transmission and anything else after. If I close and reopen the program I have to go through the same sequence to get the PTT to work. Can anyone else duplicate this and let me know I'm not crazy.

I have a Flex 3000 and I'm sorry for throwing
a complicated setup to the group so early in
the V4 Chat life.

Same setup as RMS Express. I'm using Virtual
Audio Cable which is working, at least I'm
seeing the waterfall and get a green TNC.

For PTT and Radio Control I'm using com0com
which is working in RMS Express. Com 6 which
translates to Com 16 for control and Com 7
which translate to Com 17 for PTT. RTS and DTR
selected with 56K buad. I selected Flex for
the radio. I don't see any errors in the
logs.

No PTT in two tone test or transmitting text.

134. No TX audio from external sound card, no PTT

Yahoo group: V4Protocol
Date: 2010-12-05 12:26:31 UTC
From: Ilkka
Topic: 134 Message: 134

Hi

Two somewhat different stations with the same symptoms:

1) No TX audio from external sound card. Internal sound card TX audio works (when configured so). RX audio works with the external sound card.

2) No PTT

RMS Express works OK

Station 1:
IC-756pro2, microHAM microKEYER interface (uses virtual COM ports), Tascam US-122 USB sound card, Win XP. Tried both COM/RTS and CI-V for PTT

Station 2:
IC-746pro(IC-7400), no name USB CI-V adapter, M-Audio MobilePre USB sound card, Vista

73, Ilkka OH3NJC

135. It was a brief affair.....

Yahoo group: V4Protocol
Date: 2010-12-05 14:26:39 UTC
From: n6kzb
Topic: 135 Message: 135

Had TX one time. Had TX with FEC TEST one time.

Now PTT does not work?

RMS Express with Winmor works and duplicated the setup.

Can't offer any "alpha test comments", as I can see no reason for
it only working for a few seconds.

Also I will assume that the ARQ mode is not yet implemented, as it is grayed out in the pull down menu.

Will await the next version.

Mike from XE2 land.....

136. Initial testing

Yahoo group: V4Protocol
Date: 2010-12-05 14:36:45 UTC
From: Dennis Gabler
Topic: 136 Message: 136

I am having the same PTT issues as many others. While monitoring QSO's on 40 I noticed it seems to completely stop decoding in the middle of a received transmission, or drops several frames then starts decoding again. This is on good S9 signals. I have plenty of audio going in, the receive bar is always at least 3/4 of the way over.

Still playing here,
Dennis

First I want to thank Andy K3UKA for getting me out of the ditch with V 4. We're using a RigBlaster Plus (remember). Andy told me to set my TS 570 in VOX. I did. It still wouldn't xmit. I decided that the computer was not driving the xmitter, likewise it wasn't driving the Rigblaster. On the RB you have an option of AUTO or VOX. I normally run in AUTO. We went outside the box, put the RB in VOX and guess what, we xmit. We've copied the hangout freqs 3582, 7080, 1011131, 14122 & 18075. This evening we tried the lo band stuff sending CQ's but no sales. On the HAM side of the world in the lo bands do we use LSB or USB on all bands? Thanks for the help. Looks like a great program. 73 Ed WD9DVA/AFA5QW

We tried working the bugs out on 40 (7080) apparently all are in the USB mode.

Our rig is Kenwood TS 570 in VOX, the interface is a Rig Blaster Plus, set to VOX

We can't get the CW ID to work.

We type in the lower right hand box what we want send and then hit ENTER. Out it goes.

The V4 program is in FEC

Guess we haven't got it right for bringing a txt file to send, nothing happens.

Need reports back on our signal.

I'm sure in due time, this program will do as well RMS express.

It's fun to tinker.

I have observed that too. Non v4 sigs drive the agc and drives the agc which drops the noise level and busy channel is enabled. I would rather have it be on the conservative sit and live with a little latency to avoid adding to the qrm.

149. TS-2000 and Navigator Interface

Yahoo group: V4Protocol
Date: 2010-12-05 18:15:50 UTC
From: Al
Topic: 149 Message: 149

Is anyone running a U.S. Interface Navigator interface? I run one here in conjunction with a TS-2000. No joy getting anything to work with respect to PTT so far. All connection here are via the ACC port so no microphone option here. I have tried various combinations and have not had any luck keying the radio. The software is up and running and printing many stations... Any help would certainly be appreciated...

Perseverance pays off...

I got it to transmit by entering a frequency into the "Freq (kHz)" box and double clicking on it. That, in turn, changes the frequency and then, PTT works for me using the same settings as my WINMOR configuration... Now, for some contacts...

Andy,

In the upper left box there is a column header "FREQ" with an arrow. I clicked on it and the arrow changes from down to up. I then went to send tone and it keyed the radio. Also for the CW ID.

I am using a B-2000 to a Signalink USB. This is at the camper at Camp Shelby, MS. I can't wait to get back to the house next weekend to try it on the 2000x to Microham III.

From: Chuck
Topic: 161 Message: 161

I have been on the air a couple days with V4 and noted some things. I'm using an IC-706MKIIG, Laptop with Vista and the Signalink USB.

1. Noted that using the 2 tone generator to set level, that I need to set it to 100 Watts just to get 50 Watts average while sending text.
2. I noted just after PTT, the leader tones hit 100 Watts momentarily, but keyboard text settles back to about 50 Watts thereafter.

I'm not sure, but I don't think I have seen this 3 dB jump in power during a Winmor session with the IC-7200. I have considered the possibility that the 706 transmit ALC is slow reacting, or is it possible the leader tones are a little hot. Any thoughts?

Thanks;
Chuck, WA7BRL

Jon - Clicking on the empty freq box appears to trigger the creation of a new V4Chat config file that adds the required radio & PTT control information. Below is what it added to my V4Chat config file. I had to edit the file to change the Control Baud to 4800.

Mike - KB0FX

[V4 Chat]
Antenna Baud=4800
PTT Baud=9600
Control Baud=4800
Antenna Control=
Antenna RTS=False
Antenna DTR=True
Antenna Port=None
Antenna Selection=Default
Control DTR=True
Control RTS=True
Control Port=COM8
FM=False
USB=True
USBDigital=False
Icom Address=00
Model=Kenwood Radios
PTT Port=K450
PTT DTR=True
PTT RTS=True
Tuner=False

167. Testing from FK8-New-Caledonia

Yahoo group: V4Protocol
Date: 2010-12-06 04:10:29 UTC
From: jcglt
Topic: 167 Message: 167

I did a first test on the air today on 14073. Heard nobody and was not heard too. However everything worked nicely : setup, TNC, test, CWID, a few CQs sent. I'll try again the next days.
Usually I have very good connects on WINMOR mode on 14110.5 with VK2JN-5 in Sydney (1250 miles distance) with very marginal local conditions here : a FT897D sending 30W in a mobile Hustler antenna on the balcony of my flat (5th floor), I estimate the radiated power to be around 2 or 3W only. I am interested to see the results I could achieve with this very low power on this new V4 mode.
My first comment is that I am amazed by the quality already reached at this very early stage of development, the software works, there remains to see what I shall be able to do with my QRP set.
When I activate my station I log in also in http://www.obriensweb.com/sked/
as FK8IH

Happy Holidays everybody!

Hey Jon! As far as I can tell NO you don't need anything in the Freq box to beable to TX on FEC. ARQ is disabled at this time from what I have read. (Note V4 defaults to ARQ on startup)
Also it seems for the TX to work the Squelch must be set properly (default is 5) but like you I'm still testing it.
I do have an issue with the "Leader"(aka TXD????)
I'm testing on VHF FM with the following setup:
2ea 2meter radios.
Kenwood TM-733A thru the DataPort with a Signalink USB.
Icom IC-28A with a KH6TY Interface thru the Mic Jack using a Serial port for PTT.
The Kenwood with the Signalink works just fine but I needed to set the TXDelay due to Data loss at the beginning of the TXing.
Now the issue lies with the Icom. NO TXDelay so the 1st 2 Data Bursts are lost but it will start printing on the 3rd. So to make up for the loss I insert a half line string of >>>>>'s at the beginning. I found the problem when running the built in Test feature(The QBF). It needs to be either extended or adjustable. Has anyone else seen this?

GM All,

I downloaded V4 on my work computer a little while ago and it seems to work ok on it.(At least receiving) Using the WB4MAK webSDR receiver I just monitored WB4BDS calling CQ on 7080.5 and then have a QSO with NA4C. Copy was good on both stations with only an occasional error in copy.

Now if I can figure out why I can't do that on my home computer. I only get about a third of the frames that are sent. The rest of the frames don't even try to copy! :-(

Dave K3GAU

178. [V4Protocol] working now

Yahoo group: V4Protocol
Date: 2010-12-06 15:10:45 UTC
From: Fred G -w1wyc
Topic: 157 Message: 178

Hi Andy,

I played with V4Chat a short time ago and I can get PTT working via a dedicated Comport. Reading some of the mail from others I figured I'd see what I could do. In MODE click "FEC". The FREQ referenced
is in the subject title at the top of the log page. Actually you can right click on any of the items: Contact, Name Freq, etc. and it will bring up another window where you enter contact
information. There is a write-up on it in Help under "MainV4 chat Form". Enter a contact such as, W1WYC, 14111.0, Fred, FN42jm.
Click the edit option and the contact will appear in the log, highlighted in blue. Click in the transmit buffer and enter a line of
information. Upon hitting ENTER my FT-920 sent the info. Now I have to try a real contact. The other thing I found was that I
had to have more than one contact in the log in order for PTT to work after invoking V4Chat. After bringing up V4Chat I had to click on
another entry in the log before the PTT would work. Its all stuff you can work around. Hope it helps.
Now for a real contact.

73 & GL,
Fred, W1WYC

180. New Update 0.1.2.0

Yahoo group: V4Protocol
Date: 2010-12-06 15:35:43 UTC
From: Rick Muething
Topic: 180 Message: 180

All,
I have uploaded a new update. For the near term these will NOT be auto updates but full installs. You must uninstall your present version but all settings (ini files and logs) will be maintained. This should fix at least most of the observed PTT problems and exceptions resulting in editing the send text box. Also note the green lines on the waterfall and the busy detector are now expanded to include the tuning range. For a signal to be copied it should be completely between the twin green lines.

Good luck.

Rick KN6KB

V4 Chat Revision History

12/04/2010 0.1.1.0 Initial Alpha Release. ARQ mode not enabled. Initial V4 Chat Help included.

12/06/2010 0.1.2.0 Fixed text entry window to avoid exception. Cut/copy/paste still not yet functional.
Fix initialization of Radio class to set up control ports after startup. (Verified on TS480)

V4 TNC Revision History

12/04/2010 0.1.1.0 Initial Alpha Release. Initial V4 TNC Help included.

12/06/2010 0.1.2.0 Update dblCorAvg averaging functions in V4Protocol.ThreshDetect to improve sensitivity at low S/N
Modify UpdateWaterfall and BusyDetect to include selected tuning range

181. RMS WINMOR Stations interference from V4

Yahoo group: V4Protocol
Date: 2010-12-06 15:56:00 UTC
From: Michael - VA3LKI
Topic: 181 Message: 181

It hasn't taken long before stations have determined it would be ok to place V4 operations on the same frequency as RMS Pactor and Winmor stations.

This morning no less than 3 stations have operated on the same center frequency as the RMS Winmor station - VA3LKI-5.

Two days ago I attempted to draw peoples attention to the use of the existing Pactor and Winmor frequency lists as references BEFORE they determined to operate the new V4 mode.

PLEASE REFER TO THE LISTS AND NOT OPERATE ON THE EXISTING PACTOR AND WINMOR SERVER FREQUENCIES, OR WITHIN THEIR OPERATING BANDWIDTH.

Fellows,

Why don't you move up at least one and half KHz. above the RMS stations. Like 7081.0 instead of trying to squeeze down tight on the W4JLE-5 RMS station. I've been listening to the goings on, on 40 this morning and V4 stations are having problems when the RMS station comes on. Move up frequency a bit more to 7081.0 or even a little higher! We do have VFOs!!

Hi Rick,

I just installed the latest update 0.1.2.0 after uninstalling the original 0.1.1.0. The install went fine and all seems to be working, however, the V4 Chat program still shows the version as 0.1.1.0. The V4 TNC shows the correct version 0.1.2.0.

Not a big deal, but I thought you should know just in case you need to update the Chat program or the zip distribution.

I'm on a Win7 64 bit system.

73,

Gary N7XOO

Same at VE7CRT.
Also:
Can no longer delete text in the Rx or Tx windows by highlighting then hitting the Del key on keyboard.

"Send" in User Files dropdown menu does not work any more. Cannot send 'macros' anymore.
73, Deme, VE7CRT.

This should not be an issue. RMS Winmor and Winlink Pactor stations are numerous and throughout the bands, therefore I don't know if we can say there is a specific sub-band to avoid. If the servers use their busy detect, and the V4 chatters use their ears, we should be OK. I'm not in favor of saying no one can use a server's known frequency. Rather, it should be " please don't use if the frequency is busy" ... with WInmor, V4, or anything else.

Whoops,

It does report the version incorrectly as 0.1.1.0 but it should say 0.1.2.0 my mistake missing one of the references.

Also with respect to the text windows:
These are not typical text windows which you can edit!
1) The text in the Session window (upper right) is what is sent and received (its also logged). You can't add text to it from the keyboard.
2) In the Send window you can't erase anything that has already been sent (a <CR> sends the text). So this window always shows what has been sent and what you are currently typing.

The idea of these is to give you not only a place to enter and read text but to show a history of what has happened. If you restart the program the text boxes will be cleared.

193. Good First Test

Yahoo group: V4Protocol
Date: 2010-12-06 17:09:22 UTC
From: kb3fxi
Topic: 193 Message: 193

Hello all,

I had 3 successful qso's on 7.073 USB over the last hour or so.

Noise here is about s5 today. Near perfect copy on all stations at or above about s7-s9. Negagive copy while monitoring a qso on the lighter station which was just about at the noise level.

No problems on PTT with IC-7200 running with the USB Signalink... it just worked!

I wish there were a way to type while in TX. The current configuration makes for some pretty long overs.

I see that V4 seems to be dependent on .NET. Am I correct in my assumption that the program will be limited to the Windows OS?

Looking forward to more testing. So far, so good. Thanks for a good first few alpha's!

From: Michael - VA3LKI
Topic: 194 Message: 194

Fred

Thanks for recommending V4 stations move to 7080.5 right on top of the VA3LKI-5 Winmor dial frequency!

Does the world of good for my operation. Have sent a number of messages to 'offending' stations already today.

Please folks, read the frequency and time schedules BEFORE you transmit anywhere no matter who advises you of a good frequency.

For a few hours during the day, the station here moves from 40 to 30 - and then back to 40m, and I have no problem if you keep the frequency warm during that time, but would really appreciate the same consideration during the posted Server operation times. Better yet, what happened to the suggestion of operating just above the PSK groups?

Thanks

The only problem is your all playing hell with my WINMOR RMS on 7079.5, If I could get you to move up to 7080.5 it would be much appreciated. I have a bunch of folks out on the ocean with weak signals and the V4 200 Hz away desenses my receiver. Thanks much folks, this RMS handles the most traffic of any RMS station in the US and your cooperation would be appreciated by many.

Thanks Dave,

It is a two way street. I have any number of folks out in the Atlantic that use my station. They have a heck of a ground plane, but usually a loaded backstay etc. They in many cases are really weak but still get through. When a V4 station comes on 7080 it drives my AGC down and not only is the station lost, but my blasting repeats screws up the V4 stations. Stations on 7080.5 are no problem in either direction. We have a lot of the "snowbirds" in transit this time of year and my station is in constant use.

You were solid here, too, Hoby.

The way I think I understand the tx is, you have to type your text then hit CR (enter on the keyboard) to transmit. But once you do hit enter, the program goes back to rx automatically at the point where you hit enter. Anything typed beyond that point isn't transmitted until you hit enter again.

200. V4Protocol activity in EU

Any activity in EU so far?

Latest version is now working for me with COM port PTT and tx audio functional. Not much point listening on W/VE channels during evening here in EU and 20m and 30m are stone dead quite early. So where to listen/call?

Can someone suggest an activity channel or two for EU stations. Also can we agree on which sideband to use and whether to use dial or centre frequency in specifying such channels.

Hi Steiner. Presumably you mean dial (carrier) frequency? If so can listen up there presuming no SSB activity. There is usually some mainly DL 32/1000 Olivia a little lower than that but that should not interfere.

Will set up rig on 3598 usb dial now and see what happens with 50w and a mediocre dipole.

From: Chuck
Topic: 180 Message: 203

Rick; new version loaded OK here. IC-7200 PTT now working.

Noted: Log no longer has date/time, had to put in manually.

IC-7200 will now work with radio control within one manually selected band, won't change to different bands by clicking on log entry.

The two tone test a great tool for setting the power level but has to be set to drive transmitter to 100 Watts just to get 40-50 Watts during normal data transmission. (On PTT the leader also hits 100 Watts momentarily then settles back to about 45 Watts during data transmission.)

The busy detector prevented me from finishing a QSO when a noise passed through the receive window. The choice to over ride would have helped.

I hope this is useful information for future revs.

All,
I have uploaded a new update. For the near term these will NOT be auto updates but full installs. You must uninstall your present version but all settings (ini files and logs) will be maintained. This should fix at least most of the observed PTT problems and exceptions resulting in editing the send text box. Also note the green lines on the waterfall and the busy detector are now expanded to include the tuning range. For a signal to be copied it should be completely between the twin green lines.

Good luck.

Don't sweat it Fred. Just one more opportunity to encourage V4 users to check the station listings/schedules that are readily available.

It will all get sorted out in a few days, but sometimes we have to step up and make sure our presence is known.

We took care to slip in between other Servers at the outset after moving away from Rick's frequency on 40m nearly a year ago, so that is likely why you were not aware we were 'neighbours'.

Chuck,

Read in help about setting drive level. You want it to register at NO MORE than 60-70% of your rated PEP output. E.g. 60-70 Watts out on an average reading watt meter for a 100 Watt PEP transmitter. The leader (two tone) is sent at a slightly higher level but still has the same RMS power (what an average reading watt meter reads) as the data. If you hit 100 watts PEP on the leader the average reading watt meter will read 70 Watts for both leader and data. Remember they may be several “downstream” volume/drive level adjustments past the sound card (Windows Mixer, sound card interface, transceiver drive level or mike gain).

Rick, Yes, 60% power has been the goal, same as Winmor. During my setups I have been using the Po reading on the radio. With that I see a much wider ratio between the leader or 2 tone output than 100/70. It's closer to 100/45 on both my 706 and the 7200. I see your point so will put a Watt meter in line and check it again. Downstream settings.. all at 100%. The IC-7200 USB drive level is what I use to set the transmitter Po level. These settings have been higher than with my Winmor settings as a basis of comparison.

Thanks!

Whoops,

It does report the version incorrectly as 0.1.1.0 but it should say 0.1.2.0 my mistake missing one of the references.

Also with respect to the text windows:
These are not typical text windows which you can edit!
1) The text in the Session window (upper right) is what is sent and received (its also logged). You can’t add text to it from the keyboard.
2) In the Send window you can’t erase anything that has already been sent (a <CR> sends the text). So this window always shows what has been sent and what you are currently typing.

The idea of these is to give you not only a place to enter and read text but to show a history of what has happened. If you restart the program the text boxes will be cleared.

Hi Rick,

I just installed the latest update 0.1.2.0 after uninstalling the original 0.1.1.0. The install went fine and all seems to be working, however, the V4 Chat program still shows the version as 0.1.1.0. The V4 TNC shows the correct version 0.1.2.0.

Not a big deal, but I thought you should know just in case you need to update the Chat program or the zip distribution.

I'm on a Win7 64 bit system.

Phil

The operating schedule for all of the Winmor and Pactor stations are available on the winlink.org site and by using the RMS Channels Listing module provided by the WDT. Been that way for better than a year.

Both frequencies and times are available in a user choice sort method to easily ascertain what frequencies are in use by WL2K servers.

When the discussion on where to locate a 'watering hole' was initiated back on Friday, I brought up the suggestion at that time to make use of the lists and known operating frequencies of existing Pactor and Winmor Servers, add other standard digital non-WL2K frequencies, and then slot the V4 operation in the gaps between.

Shouldn't be a problem or take much time to determine a number of 'slots' on all bands.

If you are that concerned about potential intererence and the operation of the RMS servers are that critical then its time for a review again and an education campaign may be in order. You may have to repeat your message a number of times before it everyone gets it.

Why not go closer to the psk 31 and rtty centers when doing the more efficiant fec mode? At least the psk 31 guys may getting interested. The RTTY 1000w guys might be more difficult to get interested.
They are working Stone Age Mode testing anyway. 73 la7um Finn

Dave,

Good to see in the group!

Why on Earth are you using a Signalink with a 7200? Just plug right into the USB port in the back of the radio, install the drivers and be done with it! Far better than converting to audio and back again.

I will second that idea Dave. Rick has the IC-7200 PTT solved along with the others. If you need help with the settings let me know and will send you the list that is at least working for me using both Winmor and V4. I do have to admit it is easier to set the input and output tone levels with external controls like on the Signalink, but once set up and the settings recorded, it works great including the Radio control. I now have it band switching, Frequency switching and PTT using the USB cable only.

Well, Chuck, I was going to reply to Scott but you kinda stole my thunder. I like the USB Signalink inline for the volume control on the pots for both tx and rx.

I'm doing mainly nets and ragchew with NBEMS and could really care less about rig control. I just like the ability to go to a memory channel in the rig (or spin the dial) and turn the USB Signaling tx pot to drive my power out without having to dig into the computer OS for level controls.

Hello Everyone !!
Are We having Fun Yet ??
I Have made a Few Contacts with V4, It Works Great !!
I am still having problems Controling Band-Switching and Fequency Changing with the V4 Software.
I am Using a Icom IC-7000 Radio and a US-Interface Soundcard.
Found No problems with PTT or Audio with the most Recent Software Version. Just the Issue with Frequency/Band Change.
I have no problems or Issues using this Same Hardware set-up with RMS-Express/WINMORE Software. Any Ideas ??

225. New Update 0.1.2.0

Yahoo group: V4Protocol
Date: 2010-12-07 06:18:40 UTC
From: W6IDS
Topic: 143 Message: 225

I'm quite pleased to announce that I, too, have the update installed and working.
No PTT issues. Using RMS Express setup as before with no apparent problems
as yet.

Called CQ on 7080.5, Two Tone test works as does the CW ID.
Getting random character display that is "lined-through" in the Receive pane
so there's some "activity" per se.

What does that mean, Doc? Probs with band switching?

Back in the saddle again. Heavy workload. Rotor Cuff
on the mend but still a bit stiff "here 'n there" with some
fairly good jabs of pain when I push it.

Gotta hit your replies on RMS Express poste pronto.

I just checked my ability to change freqs. clicked below
"Frequency" for a white box and entered a frequency,
Then hit ENTER - nothing happened. BTW, did not
read help file myself - just playing around.

Then I clicked back on the frequency I entered with the
mouse and voila! Changed freq/band. Clicked on the
frequency I entered to "blue it".....and typed over it for
a different frequency. I made it work again...Gotta read
up on that, but first gasp says it working. Not by the
book, I think but it's working.

Hmmm........its 2:30AM but I checked it again.......

clicked on a frequency that I entered to "blue it"....
typed in a new one, then hit enter. Clicking the
mouse on it will do nothing. Pressing enter just
moves you down a line but nothing else happened.
Clicked on the frequency with the mouse, then the
frequency changed.

Now to bed.

235. possible problem with V4 Chat 0.1.2.0

Yahoo group: V4Protocol
Date: 2010-12-07 13:24:11 UTC
From: afa4qg
Topic: 235 Message: 235

I'm running Kenwood TS870S with Rigblaster pro and XP O/S
and have found that after downloading and installing 01.2.0,
if I first send the 'Two tone test" , the program keys up my rig and sends the test, but does not toggle the PTT back off after the test. The same is true if I first select Send CWID, prior to doing anything else. It sends the CW ID fine but does not release the PTT to the rig.

However, if I select Mode FEC and make a short transmission of any kind, and then go back to either the Two Tone test or Send CWID, it works fine.

Maybe I'm overlooking something?

Thanks,
Dick, W4WEB/AFA4QG

From: Ron Wenig
Topic: 238 Message: 239

Lynn,

If you enter a frequency, in KHz, in the mini log data grid, and then click on that field it should change your frequency. For example, enter 7073 and then click on that entry. Make sure that you are in FEC mode and not the default monitor. I have entries for frequencies that I think there will be activity. Or if I see a post from someone for a QSO I will enter the callsign, name and frequency, in KHz, then click on that entry to quickly change and the call that person or click user files and send a macro that I have set up to call CQ.

Yahoo group: V4Protocol
Date: 2010-12-07 20:44:02 UTC
From: Rick Muething
Topic: 251 Message: 258

I thought this was described in the help. If AutoID is enabled (BOLD) then the SENDERS call sign is appended to the beginning of the First frame of the buff (not every frame). When the buffer empties it will repeat on the next frame transmitted. If AutoID is off it will NOT append the call sign.

Theory is that appending the call sign to every frame would be very wasteful (6 or 7 characters out of 16). Appending it to the first frame in a contiguous group identifies the sender of the frame group with modest over head. In a net environment (several operating in FEC mode on the same frequency) it is practically the only way to keep “who is who” straight. It is also operational in ARQ allowing others to “read the mail” and see who is saying what.

I’m open for other ideas on this...but think them through first please. They have to make sense and not add big and wasteful overhead.

Rick KN6KB

Topic: 254 Message: 259

Fred,

I think this is described in the help now on the Virtual TNC page (you do read that, don't you?)

The green lines are now adjusted to include the tuning range selected. E.g. if the tuning range were 100 Hz (the default) the lines would be placed at 200 Hz – 100 and + 100 or 400 Hz total. This is to indicate you should be able to copy another V4 station if that stations spectrum (which should be 200 Hz wide) is contained ENTIRELY INSIDE the green lines. If you change the tuning range (acceptable values +/-20 to +/-200 Hz) the green lines will change as well as the tuning. Tuning ranges < 100 Hz requires the station frequency to be set pretty accurately (remember the two transceivers could have errors in opposite directions).

In all cases the software automatically and quickly (about 100 ms) tunes to the correct frequency if the received signal is within the tuning range (+ or –) specified. Trying to "tweak or tune the receiver to put the desired signal in the middle (red line) is OK but won't improve the decoding since the software tunes automatically on EVERY frame.

Hope this makes sense.

Rick KN6KB

270. Re: [V4Protocol] Rig Control - FT857D

Yahoo group: V4Protocol
Date: 2010-12-08 00:53:47 UTC
From: W6IDS
Topic: 238 Message: 270

Hey Ron,

Just to clarify, you are right - generally. What "I" found is that I enter a frequency after
clicking on the "blued" area to make it white. After entering the frequency, I had to click on the line BELOW that, then click on the frequency I just entered in order to make the frequency change.

In other words, nothing is going to happen, the click won't work until you get off that line
and then come back using the mouse and click on the frequency.

Hmmm.....I hope I wrote that right. I was trying to clarify for Doc, W3CET who was having some trouble with that. Well, there's Lynn down below too for that matter.

Well anyway, there it is.

Howard W6IDS
Richmond, IN EM79NV

Lynn,

If you enter a frequency, in KHz, in the mini log data grid, and then click on that field it should change your frequency. For example, enter 7073 and then click on that entry. Make sure that you are in FEC mode and not the default monitor. I have entries for frequencies that I think there will be activity. Or if I see a post from someone for a QSO I will enter the callsign, name and frequency, in KHz, then click on that entry to quickly change and the call that person or click user files and send a macro that I have set up to call CQ.

Rick this is feedback for you. On one of Navy Mars nets tonight I successfully passed a msg for my first attempt. Worked well and received 100%. Don/W4AWP/NNN0ICX

Hi Howard,

Yep, after you enter the frequency you can hit enter then click the
field and it will change the radio. The help section says to right
click to edit the line to create a new entry. After you save it then
you can click any part of that line and it will change the frequency. I
thought it was a convenient way to quickly change frequencies by just
entering it and then clicking on it without entering any other information.

I can just barely hear some tones on frequency but no print. Hope you guys are making it OK.

277. Re: [V4Protocol] Re: Testing from FK8-New-Caledonia

Yahoo group: V4Protocol
Date: 2010-12-08 03:44:29 UTC
From: Howard Brown
Topic: 167 Message: 277

Great QSO guys. I can hear weak signals but no copy. I am running 300 watts to a yagi at 55'.

Maybe another time we can work between us.

Howard K5HB

Hi All
It appears that the tx text is being sent twice to the rx screen - once
when it is typed and again when it is transmitted
Maybe also what is needed is a control to go to TX and another to go
back to RX - instead of sending by line
The decoding was mostly very good with only once I noticed that it did
not decode for some 3 or 4 frames -
all in all quite a good test I thought
Regards
Les VK2DSG

Hi Howard
I heard a weak V4 signal and you will see I make comment about it in my
text - so that was probably you -
too low down - hihi - as you say maybe some other time - I run only
about 55 watts to 8 el log at 52 feet
Cheers
de Les vk2dsg

The Receive window is much cleaner but here's
a portion of the Log - saw N6KZB come across
on 7080.500:

2010/12/08 03:41:31 DS Richmond, IN
2010/12/08 03:41:35 KKKK
2010/12/08 03:44:10 N6KZB/XE2: cq cq
2010/12/08 03:44:16 xe2 n7M j>0e2 n6

I did try a connect but no joy. Not a bad signal,
enough to create activity in the constellation.
Didn't catch the score.

I fully agree with Les, very nice first QSO with V4 mode. I tried to test the mode blindly two days ago with no luck. Today Les and me had decided to make this test at 03:00AM Universal Time on 14,110.5 - sorry I was late by a few minutes - and it worked at the first attempt. What is interesting is my very poor conditions : Hustler mobile antenna with very low efficiency, which means I radiated only maybe 2 or 3 Watt but Les's log periodic did the job for both of us !
I was surprised to see that most red barred words (considered as badly decoded) were perfectly understandable. The pasting made by Les and copied to this group is also interesting as it shows that we could copy nearly the same words, nice. Unfortunately I tried to copy-paste but could not do it, don't know why.
I think this shows that V4 is very promising, able to work in very marginal conditions, with a mobile antenna, as emergency communication mode when the base station has been destroyed, should also be excellent for mobile and maritime mobile communications.
As said in the QSO Rick and some other OMs have made a wonderful job and I am very much grateful to them.

Hi Jean-Claude
You need to bring up the log for that time - under Logs - highlight it in there and then copy and paste
At the moment you cannot paste to the TX screen or copy from the RX screen of the program

Hi Les,
I did it before you returned. In fact I'm mostly working on Linux Ubuntu but for this V4 test I had to boot my laptop in Windows XP I hate Windows), come back to Ubuntu for my comment to this group then return to XP to read both logs : TNT log and QSO log. I could see the QSO log is the place to copy-paste currently. I studied the TNT log, everything worked fluently, no problem at all. In the QSO log I did not have this problem you mention of phrases been recorded twice, on my log they are recorded only once, maybe because I typed my phrases then clicked "Return" without trying to copy-paste ?
Anyway this was a very nice QSO.

Another comment after having compared my QSO log and My RX screen :
- the words and parts of sentences which were red barred on the screen, which means they were not well decoded are not recorded in the log, which explains why there are holes in the log copied and pasted by Les - however most of these red barred pieces were readable, understandable, without fault. If it was possible to copy - paste from the Rx screen it would be then possible to fully record a QSO.
I tried to copy-paste from the Rx screen and the only result is that everything on the Rx screen became red-barred.
I start to get a better understanding of this small wonder.

Hi Jean-Claude
I think this problem arises when you are already sending a line of text
and you have
typed another line of text and hit enter again while the last line is
still sending - it has nothing to do with
copying and pasting since at the moment - at least for me - I cannot
paste to the TX screen or copy from the
RX screen
It seems to me a better system would be to have a TRANSMIT button and a
RECEIVE button or Toggle TX ON/OFF
system and the program just sent IDLE or fill characters until more text
was sent to the buffer by hitting the Return key
or the RX or Toggle off was used - at the moment it sends whatever is in
the one line buffer then goes back to RX
(I have not yet experimented on how long this one line can be - (does
it have a specific character length for the line)
I think more testing is needed to find out exactly how this works - but
I am sure it will evolve progressively as we go
along with the testing

Hi Les,

In a couple of contacts and once by myself, I typed a BUNCH of lines and then hit ENTER. The whole thing was sent without stopping until the end was reached, maybe 10 or rwelve lines or so.
I just kept typing without hitting ENTER, letting word wrap happen.

I made up a user file which resembles a "Brag file" containing name, location, equipment, little history
and such, just to test what could be sent. The whole thing went out just fine, line by line, until the end
was reached at which point I had typed a "so BTU and we'll see how you're doing KKKK" at which
point I stopped transmitting.

I haven't seen any line restrictions per se.....unless you hit a ENTER while you're typing. That you
don't want to do I think, in so far as my thread here is concerned. Or so it seems.....

290. It be early, but... CQ ing on 14.073 n6kzb/xe2

Yahoo group: V4Protocol
Date: 2010-12-08 13:27:21 UTC
From: n6kzb
Topic: 290 Message: 290

My home station is a bit on the weak side. Antenna is a 35 foot vertical using an AH-4 coupler, surround by buildings, sigh...

But I will soon have the software installed and the Signalink working at the radio Club station of Baja, XE2BC (CREBC).

There I have access to an 80 foot tower with a 6 element tr-bander and some dipoles.

Once set up, will announce a freq and park on it. Perhaps can give Mexico out as a contact on this new mode.

Adios till then... and back to a weak "hope-for-gray-line-help" home station.

Mike n6kzb/xe2

291. Busy Detector holding off during a QSO

Yahoo group: V4Protocol
Date: 2010-12-08 13:48:04 UTC
From: John Hirth
Topic: 254 Message: 291

I ran into an interesting situation yesterday during a QSO.

The other station was well centered in the tuning passband and we were having a clean QSO. Then an Olivia station fired up with one of his end tones right against (but not inside) one of the waterfall +/- tuning lines. He was far enough away from our signals that it wouldn't have bothered many other modes. But in this case the busy detector wouldn't let me transmit for quite a while, until he eventually stopped sending. All this time my QSO partner was wondering what had happened to me. It was very awkward.

Is this a factor of how wide we have the +/- tuning set, or are there any other ways to control or manipulate the Busy Detector?

John W2KI

Date: 2010-12-08 14:30:19 UTC
From: Rick Muething
Topic: 43 Message: 293

All,

This update fixes some problems, should increase tuning and decoding capability and updates help. Session and Keyboard windows can now be cleared (right click). Please read the help to clear up any questions on how the Keyboard and Session text boxes work and when data is sent.

I need to work on some other things over the next few days as well as set up for an additional round of ARQ testing on V4Chat.

You can and should uninstall your current version and use the full install 0.1.3.0 setup. Do NOT removed or delete your .ini files unless you want to start your setup clean. They should work fine with this version and windows uninstall will leave those .ini file intact.

73,

Rick Muething, KN6KB

Revision History notes:
V4 TNC Revision History
12/06/2010 0.1.2.0 Update dblCorAvg averaging functions in V4Protocol.ThreshDetect to improve sensitivity at low S/N
Modify UpdateWaterfall and BusyDetect to include selected tuning range

12/07/2010 0.1.3.0 Fix for PTT not releasing on two tone test.
Modification of leader length to 12 (no vox) or 16 (vox) symbols for improved decoding.
Statistical tests show approx 85% decode percentage at MPP -5dB S/N. 98.5% at 0dB.

V4 Chat Revision History
12/06/2010 0.1.2.0 Fixed text entry window to avoid exception. Cut/copy/paste still not yet functional.
Fix initialization of Radio class to set up control ports after startup. (Verified on TS480)

12/08/2010 0.1.3.0 Add ability to clear Session and Keyboard text boxes with right mouse click.
Add Logging "tag" to logged Session text to show functionality
Update Help

294. Re: [V4Protocol] Busy Detector holding off during a QSO

Yahoo group: V4Protocol

Topic: 254 Message: 294

John,
The busy detector looks at frequency bins using an FFT algorithm. The range of bins examined is a function (at least in the latest rev 0.1.3.0) of the desired tuning range. So the busy detector range is essentially the space between the green lines.

NOW remember two things:
1) The bins have integer numbers and are always rounded up (wider) so depending on the values could be up to about 11 Hz wider than the tuning range + the V4 signal bandwidth (e.g. ~400 Hz for a tuning range of +/- 100 HZ) but it could be as high as about 422 Hz depending on rounding.
2) The detector is sensitive and can respond to sidebands from adjacent signals if they are present and large enough. So the detector will respond to an adjacent signal especially if it is strong or has any splatter in its sidebands. Since the waterfall has a type of AGC for its display you cannot always see the reduced sidebands.

Making a brick wall filter for the busy detector is not practical...as it would use a large part of the CPU to implement a filter with the required number of taps (probably 150 to 200 taps)

The primary purpose of the busy detector is:
1) TO warn users there is a signal in or very near the passband of interest.
2) To hold off transmission in FEC or ARQ modes if the channel is occupied and there is still outbound data queued.

You can desense the busy detector using the squelch control as described in the help file. Setting it to high values (7-10) will make the detector less sensitive.

Howard all,

Text (whether from the Keyboard text box or from a txt file) is never sent until a <CR> is seen. This allows you to “type ahead” while you are receiving. Once the <CR)> is sent the data goes into an outbound buffer and will be sent when the channel is clear and will send contiguous frames until the buffer is empty.

Subject: Re: [V4Protocol] Re: Testing from FK8-New-Caledonia

Hi Les,

In a couple of contacts and once by myself, I typed a BUNCH of lines and then hit ENTER. The whole thing was sent without stopping until the end was reached, maybe 10 or rwelve lines or so.
I just kept typing without hitting ENTER, letting word wrap happen.

I made up a user file which resembles a "Brag file" containing name, location, equipment, little history
and such, just to test what could be sent. The whole thing went out just fine, line by line, until the end
was reached at which point I had typed a "so BTU and we'll see how you're doing KKKK" at which
point I stopped transmitting.

I haven't seen any line restrictions per se.....unless you hit a ENTER while you're typing. That you
don't want to do I think, in so far as my thread here is concerned. Or so it seems.....

Hi Jean-Claude
I think this problem arises when you are already sending a line of text and you have typed another line of text and hit enter again while the last line is still sending - it has nothing to do with
copying and pasting since at the moment - at least for me - I cannot paste to the TX screen or copy from the

RX screen
It seems to me a better system would be to have a TRANSMIT button and a RECEIVE button or Toggle TX ON/OFF
system and the program just sent IDLE or fill characters until more text was sent to the buffer by hitting the Return key
or the RX or Toggle off was used - at the moment it sends whatever is in the one line buffer then goes back to RX
(I have not yet experimented on how long this one line can be - (does it have a specific character length for the line)
I think more testing is needed to find out exactly how this works - but I am sure it will evolve progressively as we go
along with the testing

Rick,

Thanks for the explanation of how the Busy Detector works.

I had a similar experience.

A Pactor station just outside the +100 indicator and this kept the Detector in the Busy state which made sense as probably the Pactor op and I where probably too close to each other.

Actually it is quite impressive how the Busy Detector works to avoid interference/collisions with other stations.

I think once one understands that there will be some amount of latency induced due to the how busy a given frequency is then it you either live with it or QSY to a less utilized frequency.

John; I had this same thing happen during a contact. A noise was drifting through the bandpass and I had to wait before I could transmit. I didn't think of it then, but next time I will try moving the Busy detector setting up to it's highest setting. Possible consequence of that? Don't know yet. A Busy detector over ride would be helpful same as Winmor.

Subject: [V4Protocol] Busy Detector holding off during a QSO

I ran into an interesting situation yesterday during a QSO.

The other station was well centered in the tuning passband and we were having a clean QSO. Then an Olivia station fired up with one of his end tones right against (but not inside) one of the waterfall +/- tuning lines. He was far enough away from our signals that it wouldn't have bothered many other modes. But in this case the busy detector wouldn't let me transmit for quite a while, until he eventually stopped sending. All this time my QSO partner was wondering what had happened to me. It was very awkward.

Is this a factor of how wide we have the +/- tuning set, or are there any other ways to control or manipulate the Busy Detector?

308. V4 Chat 0.1.3.0 Some findings during tests

Yahoo group: V4Protocol
Date: 2010-12-08 18:46:34 UTC
From: turi8712
Topic: 308 Message: 308

My equipment: XP/SP3, Flex 5000 A, PSDR 2.0.16 Beta, VAC 4.9, VSP Manager 1.0.1.017.
My settings in V4 are similar to RMS-Express
Full install did work ok.

Greetings to All!

my findings

Waterfall: when starting up, the waterfall is blue. You see ongoing activities. After the first "Send" the waterfall turns black and stays that way. I would prefer the waterfall returns to the blue version. I like to see ongoing activities.

Transmitting text: not always but quite often, the last few letters at the end of a message are not sent (text is marked with strokes)

User files: Chosing a file and "Send" places the text in the upper right window and starts sending immediately. Why? If the file would be placed at the lower right window, it could be treated like a manually typed text and edited if necessary. Sending then can be started with "Enter" (CR).
An even better alternative would be: leave "Send" as it is and introduce an additional "Move to Outbox" in the User File menue.

Macrobuttons: Why not introduce (later?) a number of editable macrobuttons similar to other digital programs: CQ, Name, QTH etc.
Macrobuttons are good help to get in contact and you do not have to retype the same text with every new contact. At the moment,I help myself using the feature "User Files".

Abort: after pushing that menue button, the sending stops, Power SDR stops, V4 Stops. You have to restart the whole lot. I think, only the sending of the actual text should be stopped?

V4 Sound card TNC: on startup the window does not place itself at the spot it has left before. The V4 Chat window does, which I prefer.

From: Rick Muething
Topic: 308 Message: 310

Arthur,

Thanks for your feedback...some questions however. I haven't tried it yet with my Flex 3000.

"Waterfall: when starting up, the waterfall is blue. You see ongoing activities. After the first "Send" the waterfall turns black and stays that way. I would prefer the waterfall returns to the blue version. I like to see ongoing activities."
The waterfall color is completely defined by the audio level going into the sound card (or VAC). If there is no audio the background will be black. there is some limited AGC to try and set the plotting colors to get the most available contrast. If your waterfall looks black it sounds like there is no audio being received (received level indicator???) In FEC mode the waterfall works full duplex (should never stop). In ARQ mode it stops during transmit. (ARQ by definition is half duplex)

"Transmitting will send everything that is in the outbound queue. If this doesn't look like it is working you NEED to enable detailed logging and look at the V4TNC log and compare it to what is showing in the V4Chat log.

"User files: Chosing a file and "Send" places the text in the upper right window and starts sending immediately. Why? If the file would be placed at the lower right window, it could be treated like a manually typed text and edited if necessary. Sending then can be started with "Enter" (CR).
An even better alternative would be: leave "Send" as it is and introduce an additional "Move to Outbox" in the User File menue. "

The problem here is one of consistency...if the text file contains <CR> they will trigger the dump to outbound buffer. It could be pasted into the Send window but then all <CR> would have to be at least temporarily purged or converted to LF etc. There are probably half a dozen ways to do this especially throwing in ideas like macro keys. BUT they have to be thought through with ALL the details and NITS (the devil is in the details applies in spades in software!). Right now I don't want to get involved into details discussions on exactly how file transmission, cut and past, back space over sent text, aborted text (still in the buffer) etc are handled. There will be time for those refinements but later. What is needed now is:
1) Bulletproof installation
2) Complete Help and documentation including specs, V4 TNC interface etc.
3) Handling/recovery from all user or program triggered exceptions
4) Optimization of decoding and tuning parameters to get the best copy possible give the propagation. This latest revision has already had about 10 revisions on this (long before Alpha release) and I expect will take several more to get close to optimal decoding.
5) Verification of the ARQ mode (definitely non trivial...I know from WINMOR!)

Remember that the V4Chat program is just ONE example of a client that uses the V4 protocol. The entire idea of a separate TNC function (V4 TNC) is to allow and encourage others to write clients that do the user interface. This lets those with good client

design/implementation experience but weak DSP skills leverage the protocol. This has worked well in WINMOR with now at least 4 programs using the WINMOR TNC.

Thanks David,

I was getting about 85% successful frame copy on the HF Simulator on a Multipath poor channel at −5dBS/N (3000 Hz noise bw). This was computed averaged over 800 frames. This improved to 98.5% at MPP 0dB S/N. V4 should be very good in a poor multipath (e.g. NVIS) environment but probably not quite as good as 16 frequency Olivia or domino which is much wider for the same data rate. My goal is to make it as robust as posssible still keeping the typing speed above 50 WPM (after FEC) and the bandwidth at 200 Hz.

Hi Howard - All
Well that was the first qso with V4 so I did not understand how things worked - hi
plug and play so to speak - hi
Next time I am sure with your info in hand and other info learned during that first qso
with Jean-Claude it will be much better - biggest problem here is the lack of other users
I have just downloaded the latest version but no qsos yet
Les

PS just seen V4chat de ve7crt pop up on my monitor
signals are very weak and hardly any trace at all on my Flex3k waterfall

Rick,

Just a little more feedback from another Flex 5000 user.

My waterfall is not turning black after "send", waterfall stays normal blue color and acts as expected.

PTT is also working properly.

Thank you for the very interesting new mode .

John , N3WT

Subject: Re: [V4Protocol] V4 Chat 0.1.3.0 Some findings during tests

Arthur,

Thanks for your feedback...some questions however. I haven’t tried it yet with my Flex 3000.

”Waterfall: when starting up, the waterfall is blue. You see ongoing activities. After the first "Send" the waterfall turns black and stays that way. I would prefer the waterfall returns to the blue version. I like to see ongoing activities.”
The waterfall color is completely defined by the audio level going into the sound card (or VAC). If there is no audio the background will be black. there is some limited AGC to try and set the plotting colors to get the most available contrast. If your waterfall looks black it sounds like there is no audio being received (received level indicator???) In FEC mode the waterfall works full duplex (should never stop). In ARQ mode it stops during transmit. (ARQ by definition is half duplex)

“Transmitting will send everything that is in the outbound queue. If this doesn’t look like it is working you NEED to enable detailed logging and look at the V4TNC log and compare it to what is showing in the V4Chat log.

”User files: Chosing a file and "Send" places the text in the upper right window and starts sending immediately. Why? If the file would be placed at the lower right window, it could be treated like a manually typed text and edited if necessary. Sending then can be started with "Enter" (CR).
An even better alternative would be: leave "Send" as it is and introduce an additional "Move to Outbox" in the User File menue. “

The problem here is one of consistency...if the text file contains <CR> they will trigger the dump to outbound buffer. It could be pasted into the Send window but then all <CR> would have to be at least temporarily purged or converted to LF etc. There are probably

half a dozen ways to do this especially throwing in ideas like macro keys. BUT they have to be thought through with ALL the details and NITS (the devil is in the details applies in spades in software!). Right now I don't want to get involved into details discussions on exactly how file transmission, cut and past, back space over sent text, aborted text (still in the buffer) etc are handled. There will be time for those refinements but later. What is needed now is:

1) Bulletproof installation
2) Complete Help and documentation including specs, V4 TNC interface etc.
3) Handling/recovery from all user or program triggered exceptions
4) Optimization of decoding and tuning parameters to get the best copy possible give the propagation. This latest revision has already had about 10 revisions on this (long before Alpha release) and I expect will take several more to get close to optimal decoding.
5) Verification of the ARQ mode (definitely non trivial...I know from WINMOR!)

Remember that the V4Chat program is just ONE example of a client that uses the V4 protocol. The entire idea of a separate TNC function (V4 TNC) is to allow and encourage others to write clients that do the user interface. This lets those with good client design/implementation experience but weak DSP skills leverage the protocol. This has worked well in WINMOR with now at least 4 programs using the WINMOR TNC.

73,

Rick KN6KB

Subject: [V4Protocol] V4 Chat 0.1.3.0 Some findings during tests

My equipment: XP/SP3, Flex 5000 A, PSDR 2.0.16 Beta, VAC 4.9, VSP Manager 1.0.1.017.
My settings in V4 are similar to RMS-Express
Full install did work ok.

Greetings to All!

my findings

Waterfall: when starting up, the waterfall is blue. You see ongoing activities. After the first "Send" the waterfall turns black and stays that way. I would prefer the waterfall returns to the blue version. I like to see ongoing activities.

Transmitting text: not always but quite often, the last few letters at the end of a message are not sent (text is marked with strokes)

User files: Chosing a file and "Send" places the text in the upper right window and starts sending immediately. Why? If the file would be placed at the lower right window, it could be treated like a manually typed text and edited if necessary. Sending then can be started with "Enter" (CR).
An even better alternative would be: leave "Send" as it is and introduce an additional "Move to Outbox" in the User File menue.

Macrobuttons: Why not introduce (later?) a number of editable macrobuttons similar to other digital programs: CQ, Name, QTH etc.
Macrobuttons are good help to get in contact and you do not have to retype the same text

with every new contact. At the moment,I help myself using the feature "User Files".

Abort: after pushing that menue button, the sending stops, Power SDR stops, V4 Stops. You have to restart the whole lot. I think, only the sending of the actual text should be stopped?

V4 Sound card TNC: on startup the window does not place itself at the spot it has left before. The V4 Chat window does, which I prefer.

I had another look this morning to the V4Chat log and TNC log of our QSO yesterday with VK2DGS and found something quite amazing :
- my V4Chat log shows single records of the QSO, with some blanks but parts of QSO are never recorded twice ;
- the TNT log shows some elements of QSO and when they are those sent by VK2DGS they are allways recorded TWICE in my computer !
Below are copied-pasted a few lines of this log.

I don’t know what the TNT logs is...you mean V4 TNC.log? or V4 TNC Debug.log? The V4 TNC debug log should be used only for debugging it has lots of additional data that most won’t understand or be able to fully interpret. The true log is V4Chat which now (in version 0..1.3.0) will show the type of text in the log making it easier to read and decipher what is sent/received/FEC/ARQ/Alarms etc.

319. Re: [V4Protocol] Test issue V4 patch 0.1.4.0

Yahoo group: V4Protocol
Date: 2010-12-08 20:59:57 UTC
From: Rick Muething
Topic: 318 Message: 319

Thanks Ken,

Looks like the abort flag isn't getting cleared upon a successful abort. I'll get it on the next rev.

One important note to all. When you are sending debug information ALWAYS include the exact and specific rev numbers (both V4TNC and V4Chat ...they won't always be the same) E.g. Kens note about V4Patch 0.1.4.0 ....there is no rev 0.1.4.0 yet!

Close doesn't count in program...it is details details details!

Subject: [V4Protocol] Test issue V4 patch 0.1.4.0

Was workgin around with menu and found that once I aborted the transmission then it will not transmit again. TNC looks like it tries but when it terminates it the abort message is the only thing posted. Below is the reference I found in the logs for you, Rick.

Topic: 167 Message: 320

Rick, the part of log copied in my last post is part of V4 TNC Debug log, I checked it again : VK2DGS words are recorded TWICE as shown in the part of log copied. I checked again also the V4Chat log for the same parts of QSO, which are recorded only ONCE there. If you need them I can separately send you copies of these two logs.

> I donâ□□t know what the TNT logs is...you mean V4 TNC.log? or V4 TNC Debug.log? The V4 TNC debug log should be used only for debugging it has lots of additional data that most wonâ□□t understand or be able to fully interpret. The true log is V4Chat which now (in version 0..1.3.0) will show the type of text in the log making it easier to read and decipher what is sent/received/FEC/ARQ/Alarms etc.

321. Re: Busy Detector holding off during a QSO

Yahoo group: V4Protocol
Date: 2010-12-08 21:38:10 UTC
From: hornet509
Topic: 254 Message: 321

John,
I had similar observations of some QSOs on 7303 yesterday. I just used passband tuning on my rig (IC7000) to narrow the passband to 400 hz. I literally watched the noise on both sides of the green lines in the Sound Card TNC Window and adjusted top and bottom cutoffs until the offending signals were eliminated. At 400 hz still showed some noise on both sides and my QSO was not effected. Mine adjacent signals were however not right up against the green line on either side.

Rick!

Is it possible to insert a line in the V4Chat.log which shows time and
frequence then the frequence changes?
I have had 2 QSO with version 0.1.2.0 but only EU no NA yet.

325. Linux Ubuntu - V4 Chat testing

Yahoo group: V4Protocol
Date: 2010-12-08 22:21:48 UTC
From: jcglt - FK8IH
Topic: 325 Message: 325

Conditions here : FT897D plus SignaLink USB plus laptop using Windows XP or Linux Ubuntu 10.04-1LTS Lucid Lynx.

Last year I tried to work RMS Express on this Linux Ubuntu system using a Virtual box, namely "Oracle VM VirtualBox". Rick explained it could not work for Vox delay reasons and he was right : RMS Express works well in the Virtual Box in "telnet" mode but does not work on "radio" modes.
As things seem to be totally different with V4 as this is a "simplex" communication mode and there are no strict delay conditions it should work well on my Linux system using the VirtualBox.

I checked this morning the settings in the VirtualBox, everything seems OK with the new V4 Chat 0.1.3.0 and I will be ready today at 03:15 Universal Time on same frequency as yesterday 14,110.5 dialed freq.
VK2DGS can you make this test with me this afternoon ?

Thanks for a nice first V4 QSO. No QRM this side, your copy was 100% with a 589 signal on the K3 S meter. Also running 25W to a very poor antenna (shortened dipole, bent to fit into a small attic) so I think this was quite a good test of the new mode.

I'm also copying SM4XFP calling you.

SIGNED DAVID KC2DMC NY

AC4M: ok
AC4M: you mi
AC4M: might want to try that one again , CW QRM
RGR I HEAR IT AND USE THE
FILTERS AND THE NOCH FILTER TOO
WITH IS SHARP K
HO COPY NOW
AC4M: kc2dmc de ac4m , is there a way to stay key up while txing? de ac4m btu
DE KC2DM I DO NOT KNOW YET
MY FIRST GOING WITH
THIS MODE AND I OR WE WILL
GET BETTER AS THIS PROGRESSES K
e way the chat is built it seem s a little forgien kind of hard to make a good turn around
in convo it seems..btu de ac4m
VE1YZ
AC4M: hello ve1yz de ac4m
you copy the ve station?
DE KC2DMC RGR
I DID COPY THE VE1YZ STATION WELL HERE K
w the name is craig here

think of this as a chat room hi hi
there?
DE KC2DMC RGR CRAIG I ALSO HAVE THIS ON THE WEB LOG AT
http://aat2ag.dyndns.org:8080/
YOU CAN SEE THE TEXT OR THE
TNC WINDOW K
AC4M: hmmm i am only getting part of your message
ryone who can hear me
AC4M: i can hear you
I DID COPY THE VE1YZ STATION WELL HERE K
DE KC2DMC RGR CRAIG I ALSO HAVE THIS ON THE WEB LOG AT
http://aat2ag.dyndns.org:8080/
YOU CAN SEE THE TEXT OR THE
TNC WINDOW K
AC4M: ok so you are broadcasting internet?
AC4M: hello n9ol
DE KC2DMC RGR YES, I HAER SOME OF OTHER STATIONS
BUT WEAK AT TIMES
I HEAR YOU THE BEST NOW K
wonder if we are clashing with weaker stations?
DE KC2DMC NOT NOW I DON"T HERE THEM ANYMORE

THE BAND IF SHIFTING HOW DO YOU COPY ME NOW K
y name is craig
STILL THERE CRAIG K
AC4M: yes still here, just listening for a respm. name here isAC4M: you must type out the whole idea before hitting enter i see
AC4M: hello tes de ac4m craig in tn
AC4M: ted i meant hi hi
N9LOH: i see kc2ve
DE KC2DMC IMI KC2DMC NAME IS DAVID IN STONE RIDGE NY K
BAND IS DROPPING OUT
AC4M: What would be neat is a listing of all stahen checking in , hello kc3ol i copy you well
N9LOH: i notice it puts our call on the start of each line nice
is Lake Quivira,AC4M: Maybe the author would think to make this software a little more automated on callsigns itm in n.e. tn with 50 watts
KC3OL: 40 watts doing nicely herKC3OL: 50 watts

331. 2-tone test request

Yahoo group: V4Protocol
Date: 2010-12-08 23:38:54 UTC
From: Jack Swift - Swift Hardware
Topic: 331 Message: 331

i want (need) to be able to turn on the 2-tone test and *while it is running* adjust the drive level in the setup window and then turn off the 2-tone test (manually) when i've finished.

right now, i have to:
set the drive level
close the program
open the program
do the 2-tone test
re-set the drive level
close the program
open the program
do the 2-tone test
re-set the drive level
close the program
open the program
do the 2-tone test
re-set the drive level
close the program
open the program
do the 2-tone test
and maybe run the 2-tone test a couple of times to make sure my eyes are working right...

but still when i run the program normally, the radio shows a different power level than i saw during the 2-tone test - and probably a different alc value.

this same thing happened in winmor and i finally gave up and assumed that my radio (756pro3) showed alc when there wasn't any so i ran at 'full drive'..

Disregard. I have discovered that once I make V4 Chat the active
window, it goes to the end of the text buffer and starts scrolling
normally again. Sorry for the bandwidth before. I should have checked
that first.

FYI
http://www.obriensweb.com/v4andwinmor.jpg

A screen shot of Winmor and V4 ran simultaneously , one radio, one PC,
4 comm ports.

Jack; As I have learned, one needs to put a Watt Meter in the coax line that reads AVERAGE power and ignore the power level (Po) shown on the radio. Set the radio to ALC and adjust your radio power to 50-60 Watts on the external Watt meter while checking the ALC has not moved up..say more than 2 bars.

If your in FEC mode you should not have to close and open the program to do repeated two tone tests and it should also turn itself off.. Another possibility is you have some RF problems in the computer.

Subject: [V4Protocol] 2-tone test request

i want (need) to be able to turn on the 2-tone test and *while it is
running* adjust the drive level in the setup window and then turn off
the 2-tone test (manually) when i've finished.

right now, i have to:
set the drive level
close the program
open the program
do the 2-tone test
re-set the drive level
close the program
open the program
do the 2-tone test
re-set the drive level
close the program
open the program
do the 2-tone test
re-set the drive level
close the program
open the program
do the 2-tone test
and maybe run the 2-tone test a couple of times to make sure my eyes
are working right...

but still when i run the program normally, the radio shows a different
power level than i saw during the 2-tone test - and probably a
different alc value.

this same thing happened in winmor and i finally gave up and assumed
that my radio (756pro3) showed alc when there wasn't any so i ran at

'full drive'..

From: Rick Muething
Topic: 167 Message: 341

Berndt,

Fairly easy to do assuming you are using the mini log to change/set the frequency. If you are using another mechanism I can't do much. I'll put it on the list. It would log as "info" to the session screen (e.g. *** Freq 12345.6 @ 21:22:03UTC) which would also log it to the V4Chat<date>.log for permanent storage.

Rick!

Is it possible to insert a line in the V4Chat.log which shows time and frequence then the frequence changes?
I have had 2 QSO with version 0.1.2.0 but only EU no NA yet.

Jack; I under stood that statement to "Close V4 Chat Setup" was only when you changed a parameter in the V4 Setup. I don't think it is a bug since it still is set up that way in the latest Rev I believe. But once that setup is complete, invoking the Two Tone test really shouldn't require any more rebooting of V4. OK, I see what your looking for with the over ride. I am using an IC-7200 and have found that the short Two Tone tests are best since my radio needed to be in receive before I could change the USB audio level in the radio's menue..

Good Luck.

Yepper, it is sort of like a "type ahead buffer" - works slick IMHO per se. I thought I'd comment
about that due to some comments I saw about sending limits of only line by line at a time - I did not see that, as I said. That's why I tried a "Brag File" of sorts to check it out and it works.

Now that I'm home, it's time to install the next generation - it's 0318Z and I'm just now getting
ready to tackle it. <SIGH> Oh well..... Thanks Rick.

Howard all,

Text (whether from the Keyboard text box or from a txt file) is never sent until a <CR> is seen. This allows you to “type ahead” while you are receiving. Once the <CR)> is sent the data goes into an outbound buffer and will be sent when the channel is clear and will send contiguous frames until the buffer is empty.

Hi Les,

In a couple of contacts and once by myself, I typed a BUNCH of lines and then hit ENTER. The whole thing was sent without stopping until the end was reached, maybe 10 or rwelve lines or so.
I just kept typing without hitting ENTER, letting word wrap happen.

From: jcglt - FK8IH
Topic: 325 Message: 348

We made this test as scheduled and it failed :
1. I started on Linux Ubuntu with Windows XP launched in an Oracle VM VirtualBox
- first I could hear a nice signal around S8 but ALL words were RED-BARRED and this time totally undecoded, unreadable.
- I sent three times CQ and every time I got the following error message written in the Rx screen "FEC Aborted - Outbound buffer purged"
2. I then rebooted the computer on actual Windows XP op system and could have a working QSO with VK2DSG
3. We decided to make a last attempt on Linux and this time :
- the received frames were still from Linux side all red-barred
- there was no more error message, I was transmitting normally during a period alike what I had seen on Windows BUT VK2DSG told me my signal was only some kind of loud noise, totally useless.

Well bad luck with this test on Linux, I keep the logs and can e-mail them to somebody interested in them.

352. Abort Command problems

Yahoo group: V4Protocol
Date: 2010-12-09 04:45:24 UTC
From: stevekb6hoh
Topic: 352 Message: 352

While playing with the abort command I have the following problem:
1. Abort itself works just fine.
(***FEC Aborted... Outbound buffer purged)

2. After a Abort I attempt to resend a file, the program continues to Abort what I'm attempting to send.

3. If I use the "Clear Text Box" command same problem.

4 I have to restart the program to be able to use it.

Has anybody else had the same problem?

73 de Steve KB6HOH

There was some back here.

Hi Steve, had a connect with Richard, K6RBS in MS
around 0450Z on 3585.

Nice signal into Richmond, IN here. This is his first day
on V4.

Seems like, Steve. Here's a copy of a portion of my Debug
going to Rick. In MY case, I also locked up in transmit -
wouldn't unkey. I had to "X" out of the program and bring
it back up.

So far as clearing the text boxes, not a problem here.

Howard W6IDS

From: jcglt - FK8IH
Topic: 325 Message: 356

I tested my audio this evening with some strong PSK31 signals on 14070 by comparing their decoding on :
- fldigi run on Linux, result excellent decoding
- fldigi run on Windows XP in VirtualBox of Linux, result totally unreadable.
This confirms the problem of SignaLink USB working normally when booted on Windows XP and when booted on Linux but not working at all on Windows XP run in a VirtualBox on Ubuntu. I need to dig it before doing new tests of V4. I compared the setup of fldigi in these three configurations, they are the same, the audio is USB Audio Codec in each instance but there lacks something in the VirtualBox (I knew that the management of USB devices is not an easy task in Oracle VirtualBox).

Jack,

It usually means the log is opened by some other program (e.g. like the Log file dialog). I have seen this a lot more with Windows 7 (not so much with Win XP). I'll look into it maybe the error can be circumvented by opening the log file for read only (no changes permitted).

360. RE: [V4Protocol] Re: Linux Ubuntu - V4 Chat testing

Yahoo group: V4Protocol
Date: 2010-12-09 13:11:52 UTC
From: Rick Muething
Topic: 325 Message: 360

Jean-Claude,

Thanks for that feedback. I am not surprised at all. At least for the V4 and WINMOR code which I know very well there are many calls to the sound card and interaction with the sound card thread that are time critical in the decoding process. I seriously doubt that any of the "Virtual Box" solutions will work well or predictably in such demanding applications.

I would like (with some serious help from a someone familiar with programs like mono) to develop a Linux version of V4 (and WINMOR) but it requires some serious effort and commitment (and of course the necessary skills).

1) Familiar enough with the VB.NET or .NET run time to be able to transfer or recode the critical routines in C for Linux.

2) Ability to use a mechanism in Linux to accommodate various sound "cards". The Windows solution is Direct X which isn't always great but it works on most sound cards.

3) A commitment to the project to see it through alpha and beta testing. To document the program thoroughly (user interface, setup and help) and to support the code (either source or binary) for a reasonable period of time.

In the past efforts (with the Paclink client and others) it has sometimes been difficult to get 3) above and that is why I put it out now as a necessary requirement. We don't need a bunch of false starts.

Those that think they can commit to the above and have some significant time to contribute to the effort are free (and encouraged) to contact me. We might want to hold off any actual coding a bit until we get the major bugs flushed out of the V4 protocol and V4Chat application.

361. RE: [V4Protocol] 2-tone test request

Yahoo group: V4Protocol
Date: 2010-12-09 13:52:59 UTC
From: Rick Muething
Topic: 331 Message: 361

Jack,

That poses at least two serious problems:

1) Changing the audio drive level on the sound card while it is playing..Not always possible if you are not using the windows mixer.

2) The danger that a two tone signal is left on..The duty cycle of that will quickly fry most amateur radios or at least shut them down with an over temp condition. Every where else in the program there are (or at least will be!!!) safeguards that absolutely kill the PTT after a certain timeout.

What I will work on is a mechanism to update the drive level value on the setup page dynamically so you can make repeated 4 second tests of the two tone after a change without requiring a restart. That ends up being a lot of code because you have to accommodate (or disable) things like changes in the sound card, keying mechanism etc. That is why now for the alpha code I just require a clean restart.

Rick KN6KB

From: V4Protocol@yahoogroups.com [mailto:V4Protocol@yahoogroups.com] On Behalf Of Jack Swift - Swift Hardware
Sent: Wednesday, December 08, 2010 6:39 PM
To: V4Protocol@yahoogroups.com
Subject: [V4Protocol] 2-tone test request

i want (need) to be able to turn on the 2-tone test and *while it is running* adjust the drive level in the setup window and then turn off the 2-tone test (manually) when i've finished.

right now, i have to:
set the drive level
close the program
open the program
do the 2-tone test
re-set the drive level
close the program
open the program
do the 2-tone test
re-set the drive level
close the program
open the program
do the 2-tone test
re-set the drive level

close the program
open the program
do the 2-tone test
and maybe run the 2-tone test a couple of times to make sure my eyes
are working right...

but still when i run the program normally, the radio shows a different
power level than i saw during the 2-tone test - and probably a
different alc value.

this same thing happened in winmor and i finally gave up and assumed
that my radio (756pro3) showed alc when there wasn't any so i ran at
'full drive'..

thanks!
very pleasing answer - and the code change can go down on 'the list'
below more critical things.
by the way, i thought we could do this in the winmor tnc setup - maybe
i didn't check that well enough...

363. Re: [V4Protocol] Logging the frequence

Yahoo group: V4Protocol
Date: 2010-12-09 14:34:04 UTC
From: Berndt
Topic: 167 Message: 363

Rick,

Thank You, nice for the frequence in log.

It should also be nice if a click on a marked row in the Minilogdatagrid always change the frequence
on the transceiver. If I do some manual tuning on the radio I must in ver. 0.1.3.0 first click on another
row in the list and then click on the desired row. Same then I start V4Chat. My radio shows 14110.0, the first
row is marked and the frequnce on it is 3583.0. I will work on this frq 3583.0 but now I must choose another
frequence and then back again to the first row.

I'm actually in Mission Viejo, CA - DM13do.

No problem connecting to either of you on 3855 - using 50W, an FT950 and a G5RV.

Hi,

I'm new to the group and have just intalled V4 software. Setup was easy and I have made my very first qso with Howard W6IDS on 20 m. Thanks a lot Howard !

This is my setup :
Flex SDR-1000 with M Audio Delta44 sound card.
Audio IN/OUT via Virtual Audio Cable v4.09.
CAT control via Eltima VirtualSerialPortDriver XP 5.5.
Windows XP Home SP3.

There is one thing I noticed in the V4 Sound Card TNC window.
The waterfall display remains black after TX. Receive is OK as is the Constellation display.
Waterfall works again after closing and restarting V4 until TX>RX when it stays black again.

73 and many thanks to the V4 team,

Eddy ON5UQ.

Hello All,

I need to ask something about the transmission format we're going to use with V4 Chat.

IMHO, this mode is no different than PacTOR I, RTTY, PSK, ets. We have a VFO to use, we're not channelized. When I make a contact, I'm inclined to CHAT, V4 not withstanding.

The only reason we're on a handful of frequencies is that no one knows where to go to get a contact. So, we tend to congregate where we're sure to find success. I suppose that's OK for now but IMHO it's going to create some bad habits in MY view. I think this is especially so when we get our hands on the ARQ capability.

That said, I'm not operating V4 as a channelized operation where I'm sharing a frequency with time constraints. I'm typing multiple lines of text and thoughts, no differently than RTTY, PacTOR, PSK, etc. I'm not thinking of multiple contacts taking place at the same time, sharing a frequency. I do entertain the "breaking station" who wants to join an FEC communication during the pause between exchanges.

What I will not do, is type a single line of an abbreviated thought and then hit ENTER to send a single line. As far as I'm concerned, that's not the way to communicate, so I'm presenting my thoughts here. I don't have an SCS modem with full duplex capability and I'm not interested in that at all. I have no interest in rapid first exchanges with multiple stations on the same frequency - it's too confusing, and not all that easy with manual typing. IMHO, if you want to TXT me, call my smart phone, not my ICOM.

Most of you, I bet, don't know that you can type complete thoughts, multiple lines and not transmit until you hit ENTER. If you do, why not do it and take advantage of a simple "type ahead buffer" while the other person is sending? When your done typing and want to send your thoughts, type "KKK" at the end then press ENTER. Otherwise, I'm going to just sit there. Don't handle V4 like you're on a private channel.

Hmmmm, unless you're mostly interested in signal reports, a score off the Constallation, location and then move on to the next conquest.

Also, after using V4 now, it's MY opinion that we do not have to find ourselves a nitch to congregate so as not to interfere with anyone else. There is no reason at all why this mode can't co-exist with RTTY, PacTOR I, etc because we have VFOs and can go where we want so long as there's no interference.

Regards,

Howard W6IDS

It might be convenient to have a "calling" frequency per band that one can monitor for CQs. After a brief "Hi", agree to move to another frequency for chatting.
Just my thought.

Boy, that's the truth. Glad you tried. BTW, I also got called by F1ABL,
but
when I swug the beam it was too late. Then picked up ON5QL, Eddy, at
JO11VA. This was his first V4 contact.

Then I picked up KA1GMN, Phil in Euless, TX who had a rompin' signal
into Indiana. He had a score of 96 BTW.

N6KZB in Baja appeared with a really good signal, score 94. Had a good
chat with him that was followed by a contact with F1AFZ, Christian. He
gave me a score of 82.

All of this on 20 meters, 14073.000. I dunno, it seems like 20 meters
is a good choice for daytime. I'm wondering how 17 meters will do?

It is a matter of choice.

If you want to engage in the legacy monologue QSOs, then by all means do so. The same goes for those who prefer one line text exchanges between two or more operators.

The idea is to explore and find out what work best for you.

One of the most difficult things for people doing K2K is to have enough patience to wait for that "KKK". But it's the right thing to do. Some of us are not very fast at the keyboard or make a lot of mistakes taking more time than the average touch typist.

What I am saying folks is during a chat, PLEASE wait for an invitation to transmit before jumping back in. Use the "KKK" or "BTU"... This is standard protocol on RTTY, PSK, etc.
and will work with V4.

That said, I like to use the enter key often just to give the other guy something to read while
this old slow typist here continues with keyboarding. This flys in the face of what Howard likes
to do, but he must be a way faster typist than I.

OUCH! Little harsh Phil. Legacy MONOLOGUE QSOs?

Well, perhaps you're right. I've run across more stations who
do not know how to exchange complete thoughts in a QSO.
and it IS to each his/her own, which is why I drop 'em like a
hot brick. Anything more than two thoughts for them and the
flow is lost.

That said, there's just a limit for ME as to how much contest
mode I can maintain. Which is why I don't contest any more
these past few years. The freq/contact/call/ area in V4Chat
display is great for those calling frequencies you mentioned.

Just so long as we do not turn V4 into a channelized operation.
We have RMS and WL2K to cover that, along with ALE.
I think it's a mistake if we do.

OOPS. There I go, silly me. Bloody monologue mode again.

Hey Chuck! No Sir! You're doing good! Keep on with it.... you're not conflicting with what I said at all, Maybe even you may have said it better from a different perspective.

I type 80 wpm yet detest the full duplex format chatting. Vocal comms with it is fine for duplexing - step all over each other if desired - it's easy
to handle.

BUT not when you're keyboarding.... again, IMHO. Tell me BTU or KKK after some thoughts. Don't hit me with having to transmit after just three words - unless I'm on the same page with you in the flow.

As far as I'm concerned, you're pretty much dead on target. AND - you reminded me that not everyone types well, which probably does explain the repetitive single line transmissions in a few cases. I probably saw that in the wrong way at the time. I'll put the Dunce Cap on for a while <GRIN>....well, for a couple of hours.

Yes, that was so cool, a Kodak moment for sure.

There was a message this week from Rick in which he mentions that
the waterfall prob stems from an audio issue or lack of it actually. If
there's audio in, you'll see it in the WF?

In that message, Rick says:

The waterfall color is completely defined by the audio level going into the sound card (or VAC). If there is no audio the background will be black. there is some limited AGC to try and set the plotting colors to get the most available contrast. If your waterfall looks black it sounds like there is no audio being received (received level indicator???) In FEC mode the waterfall works full duplex (should never stop). In ARQ mode it stops during transmit. (ARQ by definition is half duplex)

Hi,

I'm new to the group and have just intalled V4 software. Setup was easy and I have made my very first qso with Howard W6IDS on 20 m. Thanks a lot Howard !

This is my setup :
Flex SDR-1000 with M Audio Delta44 sound card.
Audio IN/OUT via Virtual Audio Cable v4.09.
CAT control via Eltima VirtualSerialPortDriver XP 5.5.
Windows XP Home SP3.

There is one thing I noticed in the V4 Sound Card TNC window.
The waterfall display remains black after TX. Receive is OK as is the Constellation display.
Waterfall works again after closing and restarting V4 until TX>RX when it stays black again.

73 and many thanks to the V4 team,

Eddy ON5UQ.

From: Rick Muething
Topic: 377 Message: 382

Thanks Chuck,

Some good suggestions. I'll try and include something along this line in the Help file (someone might actually read it!). I'm sure we can work out some other good ground rules to help in the keyboard chat mechanism.

I had originally conceived it something like VOX on voice but that might not be the best approach. By holding off on sending the keyboard text until a <CR> is detected my intent was to allow one to answer/edit questions WHILE they were still receiving and then sending the <CR> after a link turn over (K) was received.

Other well thought through suggestions on how this works are welcome..they aren't however specific to the V4 protocol .just the V4 Chat program.

Subject: Re: [V4Protocol]

One of the most difficult things for people doing K2K is to have enough patience to
wait for that "KKK". But it's the right thing to do. Some of us are not very fast at
the keyboard or make a lot of mistakes taking more time than the average touch typist.

What I am saying folks is during a chat, PLEASE wait for an invitation to transmit
before jumping back in. Use the "KKK" or "BTU"... This is standard protocol on RTTY, PSK, etc.
and will work with V4.

That said, I like to use the enter key often just to give the other guy something to read while
this old slow typist here continues with keyboarding. This flys in the face of what Howard likes
to do, but he must be a way faster typist than I.

Subject: Re: [V4Protocol] Re: Testing from FK8-New-Caledonia

Hello All,

I need to ask something about the transmission format we're going to use with V4 Chat.

IMHO, this mode is no different than PacTOR I, RTTY, PSK, ets. We have a VFO to use, we're not channelized. When I make a contact, I'm inclined to CHAT, V4 not withstanding.

The only reason we're on a handful of frequencies is that no one knows where to go to get a contact. So, we tend to congregate where we're sure to find success. I suppose that's OK for now but IMHO it's going to create some bad habits in MY view. I think this is especially so when we get our hands on the ARQ capability.

That said, I'm not operating V4 as a channelized operation where I'm sharing a frequency with time constraints. I'm typing multiple lines of text and thoughts, no differently than RTTY, PacTOR, PSK, etc. I'm not thinking of multiple contacts taking place at the same time, sharing a frequency. I do entertain the "breaking station" who wants to join an FEC communication during the pause between exchanges.

What I will not do, is type a single line of an abbreviated thought and then hit ENTER to send a single line. As far as I'm concerned, that's not the way to communicate, so I'm presenting my thoughts here. I don't have an SCS modem with full duplex capability and I'm not interested in that at all. I have no interest in rapid first exchanges with multiple stations on the same frequency - it's too confusing, and not all that easy with manual typing. IMHO, if you want to TXT me, call my smart phone, not my ICOM.

Most of you, I bet, don't know that you can type complete thoughts, multiple lines and not transmit until you hit ENTER. If you do, why not do it and take advantage of a simple "type ahead buffer" while the other person is sending? When your done typing and want to send your thoughts, type "KKK" at the end then press ENTER. Otherwise, I'm going to just sit there. Don't handle V4 like you're on a private channel.

Hmmmm, unless you're mostly interested in signal reports, a score off the Constallation, location and then move on to the next conquest.

Also, after using V4 now, it's MY opinion that we do not have to find ourselves a nitch to congregate so as not to interfere with anyone else. There is no reason at all why this mode can't co-exist with RTTY, PacTOR I, etc because we have VFOs and can go where we want so long as there's no interference.

Hi Rick,

Thank you for your response and the great job with V4.

I did some further test concerning my waterfall.
Setup: Receive level = 70 - 80 % of green area, Status TCP and Soundcard = green, Capture = blue WaitLeader, Playback = blue, Busy Detector = 5, Waterfall on startup = blue, moving

Menue Test:
- Two test tone: works, transmit spur visible, returns to blue again
- FEC Loop Test: works, transmit spur for 1st frame visible, after
that black, at the end of message one small blue line,
afterwards waterfall remains black. I can still hear (but not
see) adjacent PSK signals = there must be some input.
- CWID Similar to FEC Loop Test

Typing Text: "cq cq" and CR: sending starts, transmit spur for the
first (and only) frame visible, waterfall returns to blue again
"cq cq cq": same result as above
"cq cq cq cq: similar o FEC Loop test, waterfall remains black

Logs I had a look at them and can see that signals have been transmitted (Power approx. 30 watts) but being not an insider, my understanding is very limited.

PS: I have tried these tests with different settings, also on the
Flex 5K - side but with the same results.

Hello John N3WT

Thanks for your reply to Rick conerning the F5K waterfall.

I am interested to know your settings in
PSDR VAC Buffersitze, Sample Rate, Gain, Latency
DSP Otions NR, ANF, Buffersize Digital
AGC Slope, Max Gain, ALC
CAT Cat Control, PTT-Control
V4Chat: Radio Setup

PS: My settings are used in RMS-Express without any problems. The same settings in V4 will not work with my waterfall which is turning black after the first frame is sent. It does not return to blue again. I am not sure is it a problem on my side or one of V4.

Hello Arthur,

Same happens with me on Flex SDR-1000 with VAC 4.09 and Eltima VSPD 5.5.
I did some more tests and found that it only happens if a VAC channel is used for receive.
Not if I use an external soundcard. So, I guess it must be a VAC problem or Windows
changing soundcard settings.

That was my guess too Eddy.

While VAC is conceptually a simple "patch cable" connecting audio "ports" it is really much more complex especially if it involves sample rate or format conversion (possible within the VAC setup). When operating V4 in FEC mode (which is set for full duplex) the receive channel is never touched and should continue supplying samples even during transmission (assuming the radio is capable of supply received audio while transmitting). Maybe the Flex code or VAC prevents that with the setup. I'll have to look into it but not until I get the other major problems fixed and ARQ mode test out. Depending on your VAC setup you may have several "sound card" type devices all running at the same time.technically possible but also a significant CPU/OS load and opportunity for lots of configuration dependent problems. At this stage of V4 development the operative word is "KISS" until we get all the major known bugs squashed!

388. Using v4 Chat for the first time

Yahoo group: V4Protocol
Date: 2010-12-09 19:21:56 UTC
From: my_call_is_ac4m
Topic: 388 Message: 388

Last night was the first time I used v4 Chat on 80m , we had around 8 or 9 people to check in with us,

I think it would be nice if the software would automatically grab call signs. Maybe a way to click on one call sign if the message is meant only for them type of thing.(that became a confusion issue last night)

When a station checks in in a round table environment it would nice if the software would list all the stations automatically that they are hearing to just be able to juggle a high amount of traffic so they don't get lost in the mix and maybe have it automatically delete contacts as they are signing out if they sign out properly.

last night it seemed that one major question is everyone hearing each other type of thing. IF the software did that automatically it would show who is not hearing each other (by listing all stations signing in). But I am sure that would take some time listening before checking in though.

I did a test last night and went all the way down to my lowest wattage setting the radio will do and I think everyone was hearing me okay. The mode seemed pretty sensitive as far as I could tell but I did not have any check ins from EU on 80m either to see what 4,000 miles would be like on that mode on 80m.

I notice the mode had a hard time dealing with deep multi path moments in an 80m environment which only happened around 15% of the whole time that I was on the air in the mode.

Other than that I had a hard time training my brain that it was a chat room and not a normal type QSO If you listen for the tail end of the mode you know they are finished typing. The long tail with a blurb right at the end.

Hi Howard and Rick
There is a problem with using the ENTER key to key the transmission process
Using this method it does not give the user the ability to control how
the text is displayed
at the receiving end - and I believe this is important
The use of the multi line buffer is fine but what I believe is required
is either TX/RX buttons
or a single TXtoggle button
This then gives the ability to immediately to start to reply as soon as
the other station
starts his/her transmission and the text then can be set out as required
with the use of the
ENTER key - then when you receive the KKK or BTU on the end of the
transmission you can
just hit the TX or Toggle button to go to TX and continue typing - if
you still need to add text - at the end of your
typing you can the hit the RX or Toggle button to close that transmission
I think I said this after my first use of the V4 software
Regards

how about a <ctrl>-<Spacebar> or <ctrl>-<Enter> combination to insert
a CR/LF but not transmit?

however, i don't really see a problem with sending a line-at-a-time as
long as i pick my correspondents so that i know they understand to
wait for the KKK. and perhaps i should send KKK<enter> a couple of
times quickly...

the only concern i have is that i often see olivia transmissions
without a KKK or AR - because they didn't decode properly.... if that
happens here (and fec would allow it) someone could be sitting waiting
for the turnover.

i'm not sure i'm contributing to "an answer" or just compounding the problem...

Regarding your statement below - not the case as at the end of the
transmission
you know it has been handed over wether or not it contains BTU or KKK
you are not sitting waiting to see if the other person is going to tx again
Les

Howard,

You bring up some good points and suggestions. Let me add some thoughts of my own.

1) First we need to remember the software we are playing with is very new not yet a week into ALPHA testing. It still has bugs, learning curves, operational procedures to work out etc. That takes time and effort.

2) Remember there are TWO parts to what we are testing. The first is the actual V4 protocol and its implementation in the V4 TNC "helper" program.. That's the documented protocol of how to send the bits and how to connect/work with other stations. You can consider that similar to Pactor, Packet, RTTY, CW etc.all protocols. The second is the V4 Chat client program designed to use the V4 Virtual TNC similar to how it might use a Pactor or packet TNC. How it exchanges words, buffers, handles type ahead, <CR>, sending files, controlling radios etc are all just part of V4Chat. None of that has anything to do with the actual V4 Protocol (by design). If V4 proves to be a useful protocol (in other words works well enough in poor multipath propagation where other modes like PSK31 start to fail) then I expect there will be several other Clients made using the same V4 Virtual TNC. (As an aside this is also how WINMOR is partitioned and there are now 5 or so "clients and servers" using WINMOR. Probably a few more over the next year.)

3) Lets keep in mind V4 (at least as I conceive it) is for manual keyboard to keyboard operations (chats). We already have some good tools to move messages error free with attachments from clients to servers (RMS Express, Paclink, AirMail, BPQ32, Outpost, RMS Pactor, RMS Packet, RMS WINMOR etc). Those by their Client/Server nature will want to hang out on specific pre determined frequencies. Chats are more for impromptu QSO's, contests, perhaps some informal nets (on a scheduled frequency and time but not continuously active). There might evolve V4 "areas" on certain bands just like PSK but that is something that will happen naturally if it gets popular and adopted. No one or no mode "owns" any frequency. By keeping the bandwidth fairly small (compared to P2 and P3, MT63 and Olivia/Domino) we should be able to pack in several QSOs in some small segment of a band just as PSK31 does today.

All this takes some time to flush out so we shouldn't expect to have all the answers yet. In my mind have a few "watering hole" frequencies where we can see who's listening, call CQ etc. I don't think anyone should look at those frequencies as anything permanent. Where the users of a mode will "hang out" is something that is next to impossible to "legislate" anyway. What will be more productive at this stage now is figuring out how to make it robust (without making it dog slow of course!) and what V4Chat features and

operating practices make it fun, useful and efficient.

I think we're off to a good start for being 5 days into ALPHA testing!

73,

Rick KN6KB

Subject: Re: [V4Protocol] Re: Testing from FK8-New-Caledonia

Hello All,

I need to ask something about the transmission format we're going to

use with V4 Chat.

IMHO, this mode is no different than PacTOR I, RTTY, PSK, ets. We

have a VFO to use, we're not channelized. When I make a contact,

I'm inclined to CHAT, V4 not withstanding.

The only reason we're on a handful of frequencies is that no one knows

where to go to get a contact. So, we tend to congregate where we're

sure to find success. I suppose that's OK for now but IMHO it's going

to create some bad habits in MY view. I think this is especially so

when we get our hands on the ARQ capability.

That said, I'm not operating V4 as a channelized operation where I'm

sharing a frequency with time constraints. I'm typing multiple lines of

text and thoughts, no differently than RTTY, PacTOR, PSK, etc. I'm

not thinking of multiple contacts taking place at the same time, sharing

a frequency. I do entertain the "breaking station" who wants to join

an FEC communication during the pause between exchanges.

What I will not do, is type a single line of an abbreviated thought and

then hit ENTER to send a single line. As far as I'm concerned, that's

not the way to communicate, so I'm presenting my thoughts here. I

don't have an SCS modem with full duplex capability and I'm not interested in that at all. I have no interest in rapid first exchanges with multiple stations on the same frequency - it's too confusing, and not all that easy with manual typing. IMHO, if you want to TXT me, call my smart phone, not my ICOM.

Most of you, I bet, don't know that you can type complete thoughts, multiple lines and not transmit until you hit ENTER. If you do, why not do it and take advantage of a simple "type ahead buffer" while the other person is sending? When your done typing and want to send your thoughts, type "KKK" at the end then press ENTER. Otherwise, I'm going to just sit there. Don't handle V4 like you're on a private channel.

Hmmmm, unless you're mostly interested in signal reports, a score off the Constallation, location and then move on to the next conquest.

Also, after using V4 now, it's MY opinion that we do not have to find ourselves a nitch to congregate so as not to interfere with anyone else. There is no reason at all why this mode can't co-exist with RTTY, PacTOR I, etc because we have VFOs and can go where we want so long as there's no interference.

I think the problem is one instinctively hits Enter to start a new line and then curses as it starts to transmit. I did that yesterday during my QSO with LA5VNA.

I'm not too fussy about the interface as I envisage integrating the TNC with my own home-brew logging program anyway and I'm guessing its main function is just to provide a way for people to test the new mode rather than compete with HRD. But I would vote for a Send button. A CQ button would be nice, too.

From: Ron Wenig
Topic: 308 Message: 396

Arthur, I have a Flex 3000 and here are my settings if it will help. These are the same settings that I use for RMS Express.

VAC Buffersize 1024, Sample Rate 96000, TX Gain 1 (I have to cut it back some from RMS Express to get to an ALC of 0, Latency 5, DSP Options NR 40, 30, 15, ANF 65, 50, 25, Buffersize 1024, AGC Slope 0, Max Gain 87, ALC 2, 10, 500, I use com0com for ptt and radio control, Radio Setup Flex Radios, USB Digital. My waterfall is always blue.

Rick, I was curious about the receive taking sample audio. While I'm transmitting a line of text will appear in the receive block, sometimes with a line through it and garbage characters. I was wondering why it is sampling my transmission and how does it know what the quality of my transmission is. From your explanation I guess it's supplying samples and if there is noise or another station I will get the line through my text. Also, I guess this proves that VAC is allowing the samples to come through.

Ron ny3j

I am interested to know your settings in
PSDR VAC Buffersitze, Sample Rate, Gain, Latency
DSP Otions NR, ANF, Buffersize Digital
AGC Slope, Max Gain, ALC
CAT Cat Control, PTT-Control
V4Chat: Radio Setup

PS: My settings are used in RMS-Express without any problems. The same settings in V4 will not work with my waterfall which is turning black after the first frame is sent. It does not return to blue again. I am not sure is it a problem on my side or one of V4.

397. RE: [V4Protocol] Re: Testing from FK8-New-Caledonia

Yahoo group: V4Protocol
Date: 2010-12-09 23:51:07 UTC
From: Rick Muething
Topic: 167 Message: 397

Les all,

I thought I was making myself clear on this. I do not at this time want to get bogged down into a never ending debate on the best, or most natural, or most flexible or . way to send text. The V4 Chat initially is just a text vehicle to verify and exercise the protocol. Sure we can make some refinements add buttons, bells, whistles etc down the road. BUT we are 5 days into alpha testing and now is NOT the time to start designing/building the camel (Horse by committee). Lets focus on getting the protocol right, solid, robust and working well (along with the ARQ which is not at all trivial) before we start trying to come up with the perfect client (From experience I doubt there is such an animal anyway!)

So inputs are fine but lets first try and get what is implemented now working reliably and understood by all. If there is something I missed or won't allow it to work I'll fix it but whether we use a <Cr> to send the text, a user defined button to send the text or a 3 key sequence to add a blank line in the text is probably not going to be productive toward the main goal at this time. The sooner the protocol is completed and optimized and the V4 TNC is fully documented the sooner everyone can start playing around with their own client and GUI.

Hi Howard and Rick
There is a problem with using the ENTER key to key the transmission process
Using this method it does not give the user the ability to control how the text is displayed
at the receiving end - and I believe this is important
The use of the multi line buffer is fine but what I believe is required is either TX/RX buttons
or a single TXtoggle button
This then gives the ability to immediately to start to reply as soon as the other station
starts his/her transmission and the text then can be set out as required with the use of the
ENTER key - then when you receive the KKK or BTU on the end of the transmission you can

just hit the TX or Toggle button to go to TX and continue typing - if you still need to add text - at the end of your
typing you can the hit the RX or Toggle button to close that transmission
I think I said this after my first use of the V4 software

Rick,
I also tested after my last post an installation of "fldigi.exe (Windows version" on my computer booted in Linux , using "wine". Even worse result compared to what I got in the "Oracle VM VirtualBox" : I could see an "USB audio codec" in the VirtualBox setup but it did not work ; this "USB audio codec" did not show at all in "wine" !
I am not the guy you are waiting for to develop Winmor and V4 under Linux. I can "swim" easily through a Linux developped by talented people but I am totally unable to write pages of C-code, which is the kind of people you are expecting to find.
Anyway I am still very happy to have Winmor and V4 as efficient communication medium as they are, thanks to talented developers like you and others around you and this gives me the only opportunity now to boot my computer in Windows op system.

399. unhandled exception

Yahoo group: V4Protocol
Date: 2010-12-10 01:18:44 UTC
From: Charles Blackburn
Topic: 399 Message: 399

Well...

We know the reports of an unhandled exception are true.... I just got it (again), but this time I cut n pasted the exception below. Again this does NOT appear in the exceptions log. And all I have done is right click and cleared the text boxes...

Charlie

Topic: 400 Message: 401

Yea jon that was me.

I use a ts480SAT - all factory, no mods or filters. The only thing I have done is set the dsp to 800 <-> 220Khz bandwidth to try and help with the background noise that I have to suffer from.

What Jon's saying was that. I could hear him occasionally when he was strong, I couldn't decode him and just got garbage. So I started playing around on his next over I had turned off the AGC and reset the volume output on the data jack (volume gets louder when you turn it off) and it decoded fine.

Yet when russell NC5O transmitted, same signal level with the agc on slow, good decode. Turned on the AGC to fast and bad decode, just garbage. So it seems that for the 480 and my situation at least either slow agc or no agc seems to work, but until I can get a decent antenna up (read as not using the porch frame), as they say... YMMV

Btw this was on 40m at 01:50z

Yes, also noticed that here too Jon. I set the agc to slow and my decode rate goes up. The other thing is rf gain. I think I had it set too low for signals that are 10 over.

Jon, All

V4 Works on audio and wants to see audio that has a fairly constant level. Although the modulation mode is somewhat different than some of the WINMOR modes the AGC settings should be the same and make for easy operation.

Normally the best settings:

AGC Slow

NB Off

The only time turning AGC off may help is if there is strong adjacent (still in the receiver pass band but not between the V4 pass band "green lines"). Turning off the AGC will then reduce the capture effect of the adjacent signal but it might cause the interfering signal to over load the sound card. Placing a notch over the offending signal may be more productive.

The problem with turning AGC off is then you must constantly adjust the RF or audio gain to keep the sound card in some linear range (the green segment of the Rcv level). In a fading channel (very typical of multipath or NVIS) the AGC is the best vehicle for maintaining approximately constant audio levels. If you overload the sound card input all bets are off.

Decoding problems (assuming the signal is at least 0dB S/N or better) is usually the result of:

a) Off frequency (outside the green lines) operation. The capture range (+/-20 to +/-200 HZ) is set specifically to only accept signals between the green lines.

b) Audio levels outside the sound card range. The Green band in the receive level bar represents from 1/16 to 7/8 full scale on a 16 bit sound card. It may work below that (in the blue) but it will have much reduced dynamic range. Overloading the sound card (in the red) will always cause problems.

c) Something related to the computer timing or demodulation code. There is still some chance of this despite lots of testing here on the simulator and over the air. The ONLY way these problems can be identified is by careful examination of the V4TNC debug log. You have to really understand the protocol details for this. I will be happy to do this but need the following:

1. The entire V4 TNC.debug log for the date in question. The entire file as an attachment (best to send directly to rmuethingATcfl.rr.com)

2. A description of what were the conditions where
you suspect the decode had a problem. E.g. band condition, Noise level,
interference, observed results.

3. The UTC Time where the condition in 2 started to
occur. Without ACCURATE UTC time I have no way of finding it in what could
be a huge log. Sending me the log without a good UTC time pointer is just a
waste of time. I can't fish trough files hundreds of K long.

d) A sound card that has a large sample rate error. MixW has a
neat little utility program that will give a pretty good measurement (using
the PCs internal clock as a reference) of the sample rate. For V4 we would
like to see an accuracy of better than about 1000 ppm at 48000 sample rate
for receive and 12000 sample rate for playback although there is software to
help adjust for up to 4000 ppm error. For comparison after testing many
SignaLink USBs and other sound cards they tend to have error rates in the
low hundreds ppm at those specific sample rates.

As a reference: on the HF simulator I get about a 98.5% frame decode
accuracy (over a long average of 800 frames) on a CCIR Multi path poor
channel at 0 dB S/N (3 KHz noise bw). That is a signal that may move the S
meter but not much.

These are not unexpected problems and similar to what we had work through in
the early testing of WINMOR. But solutions require good debugging skills and
discipline.

407. RE: [V4Protocol] unhandled exception

Yahoo group: V4Protocol
Date: 2010-12-10 13:30:41 UTC
From: Rick Muething
Topic: 399 Message: 407

Thanks Charles,

By its very description an Unhandled exception is well."unhandled" so could never be in the exceptions log. It is the last ditch mechanism that is put in to the code that says basically. "Some exception happened where none was expected (handled) so just log the stack trace and end the program"

With this I can usually track down the area and at least put it inside what is called in .NET as a "Try Catch" structure to "handle" it and get more information about what is causing it.

Date: 2010-12-10 14:37:46 UTC
From: WarrenM
Topic: 333 Message: 409

I an new to this group and mode and was wondering what frequencies that the alpha testers have been using on 40m and 20m. I do not know if this was discussed before, if so I apologize in advance.

I installed it yesterday and all seems to work. I have yet to see any activity on 40 and 20 as I do not know yet where to listen. I searched all day yesterday.

If someone would tell me a frequency and time they will be on I would like to monitor to see if my setup is working.

Normally I work JT65A and Olivia modes. I am especially interested in seeing how this mode is going to work in times of emergency as I am a RACES member. After reading the specs and goals it looks to have great potential.

I am impressed with the developers (KN6JB and other) on this team as they have the skill set to pull this off.

410. RE: [V4Protocol] Using v4 Chat for the first time

Yahoo group: V4Protocol
Date: 2010-12-10 14:42:07 UTC
From: Rick Muething
Topic: 388 Message: 410

Thanks for the inputs. But one of the things you have to understand is there are real differences between FEC (forward error correcting ONLY) transmissions and ARQ (automatic retry request ..which usually uses FEC as well).

FEC cannot by its nature insure everyone copies. There is no feedback path from receiver to sender.

ARQ can insure error free copy since the receiver ACKs when it gets the data and the sender keeps trying until he gets an ACK.

For a net (group of users ARQ is not easy and usually not practical..Every receiver would have to ACK and it would be next to impossible to prevent collisions without dramatically killing throughput. So ARQ is usually only for two "connected" stations. the information sending station or ISS and the information receiving station or IRS.

These issues are not unique to V4 but all FEC and ARQ protocols.

Some of your ideas might be able to be incorporated but there always has to be compromises. For example in the current V4 if you enable Auto ID your call sign is tacked on to the front of the first lead frame e.g. "KN6KB:" but that adds overhead. For a single V4 frame (16 characters) that consumes say 6 of the 16 characters or over 37% . a pretty high tax. For a number of contiguous frames the overhead is of course less.

The FEC net is a tricky environment and while there may be some things that can be incorporated into the V4 protocol or V4 chat to better accommodate this I don't believe we should be focusing on these issues at this time. We are only 6 days into ALPHA testing and the most important issues now are making the protocol and its V4 TNC software as bullet proof and robust as possible. ONLY AFTER that is complete (which my best guess is perhaps 2-3 months) should we start concentrating on application detail like collecting call signs on frequency etc. This is just typical of properly engineering the protocol.

In this kind of development (Protocol and Clients using the protocol) it is absolutely essential to have a solid and proven base upon which to build and that starts with the basic protocol, its specification and its implementation. Then others can focus on the many ways that protocol can be packaged and utilized in clients and servers.

412. RE: [V4Protocol] Using v4 Chat for the first time

Yahoo group: V4Protocol
Date: 2010-12-10 14:52:51 UTC
From: Warren Moxley
Topic: 388 Message: 412

"In this kind of development (Protocol and
Clients using the protocol) it is absolutely essential to have a solid and
proven base upon which to build and that starts with the basic protocol, its
specification and its implementation. Then others can focus on the many ways
that protocol can be packaged and utilized in clients and servers. "

Do you think that FLdigi will be able to add this protocol / mode in the future or do you think that V4 is too specialized like JT65 type modes are.

Thanks for the inputs. But one of
the things you have to understand is there are real differences between FEC
(forward error correcting ONLY) transmissions and ARQ (automatic retry request ….which
usually uses FEC as well).

FEC cannot by its nature insure everyone
copies. There is no feedback path from receiver to sender.

ARQ can insure error free copy since the
receiver ACKs when it gets the data and the sender keeps trying until he gets
an ACK.

For a net (group of users ARQ is not
easy and usually not practical….Every receiver would have to ACK and it
would be next to impossible to prevent collisions without dramatically killing
throughput. So ARQ is usually only for two “connected” stations…
the information sending station or ISS and the information receiving station or
IRS.

These issues are not unique to V4 but all
FEC and ARQ protocols.

Some of your ideas might be able to be
incorporated but there always has to be compromises. For example in the current
V4 if you enable Auto ID your call sign is tacked on to the front of the first lead
frame e.g. “KN6KB:” but that adds overhead. For a single V4
frame (16 characters) that consumes say 6 of the 16 characters or over
37% … a pretty high tax. For a number of contiguous frames the

overhead is of course less.

The FEC net is a tricky environment and
while there may be some things that can be incorporated into the V4 protocol or V4 chat to better accommodate this I don’t believe we should be focusing on these issues at this time. We are only 6 days into ALPHA testing and the most important issues now are making the protocol and its V4 TNC software as bullet proof and robust as possible. ONLY AFTER that is complete (which my best guess is perhaps 2-3 months) should we start concentrating on application detail like collecting call signs on frequency etc. This is just typical of properly engineering the protocol.

In this kind of development (Protocol and
Clients using the protocol) it is absolutely essential to have a solid and proven base upon which to build and that starts with the basic protocol, its specification and its implementation. Then others can focus on the many ways that protocol can be packaged and utilized in clients and servers.

I was able to QSO with AG4QX and three others today on V4 - 14073.0.
I received all of my QSOs with no strick-thrus. I don't know if I was received that good by others but my decodes worked great. I was running 20-35 watts today.

Amazing, mode.

Good job on the software development guys.

I was wondering how this compares with Olivia or Contesta (250/8) or (250/4).

Warren,

You were strong on the exchanges we had but then just went away. I saw a partial from W4NNN calling KB0E. KB0E and I exchanged several messages and he went away and then you and I exchanged several messages and then faded away. I did see several signals on the same frequencies but they did not decode although they looked strong enough. Everything worked as expected although it is really inconvenient to have to delete what I have pre-written to change something at the beginning. These were my first two way comms.

Hi Warren; Ours was a trying QSO to say the least...your signal was doing OK with normal QSB. But I would get a few words then a few words with the strikeouts, this kept repeating. There is a pulsing noise I am getting from someones electric fence or something and it seems to knock out copy for a few words.. So, the mode is a little sensitive to some kinds of noise I guess.. OH well. Thanks for hanging in there and doing the QSY.

You are right about that. It seemed to me that someone wanted to follow us around and QRM us with PSK31. I guess I should have stopped and gone to PSK and find out what the issue was with this guy. I have never had anyone do that before.

Anyway I got ZERO strike-thrus on no one on this mode today. I either received a QSO and did not receive a QSO. Very strange indeed!

I have never had this kind of experience before. The constellation was almost perfect on everyone I received even those who were weak.

All of my QSOs were on 14.073 plus or minus 1000hz.

Does anyone know how this compares with Olivia or Contesta (250/8) or (250/4)?

Great Mode.

419. WHICH WAY TO GO

Yahoo group: V4Protocol
Date: 2010-12-10 23:59:06 UTC
From: Ed Woods WD9DVA
Topic: 419 Message: 419

We use a TS 570 with a Rigblaster into a RW 90 iat 40 feet. In ver 1010 we ran the RB and 570 in VOX. We made a few qso's. When 1020 came along I found that we could xmit w/o the 570 and the RB in VOX. Made a few QSO's. Now in 1030 with the RB and 570 in VOX we xmitt a file or do a manual the characters go out, but followed by symbols or short lines of garbage. Still in 1030 we drop the VOX in the 570 and the RB, the garbage goes awy, but we dont see anyone. Ideas? 73 Ed WD9DVA

You are right about that. It seemed to me that someone wanted to follow us around and QRM us with PSK31. I guess I should have stopped and gone to PSK and find out what the issue was with this guy. I have never had anyone do that before.

Anyway I got ZERO strike-thrus on no one on this mode today. I either received a QSO and did not receive a QSO. Very strange indeed!

I have never had this kind of experience before. The constellation was almost perfect on everyone I received even those who were weak.

All of my QSOs were on 14.073 plus or minus 1000hz.

Does anyone know how this compares with Olivia or Contesta (250/8) or (250/4)?

Great Mode.

Hi Warren; Ours was a trying QSO to say the least...your signal was doing OK with normal QSB. But I would get a few words then a few words with the strikeouts, this kept repeating. There is a pulsing noise I am getting from someones electric fence or something and it seems to knock out copy for a few words.. So, the mode is a little sensitive to some kinds of noise I guess.. OH well. Thanks for hanging in there and doing the QSY.

Bill,

Yes, the same thing happened to me. You were there and then you weren't, like a light switch. Weird band conditions I guess.

Looks to me that not much is wrong with the software, works great for me.

This was the my first few QSOs on this mode.

Warren,

You were strong on the exchanges we had but then just went away. I saw a partial from W4NNN calling KB0E. KB0E and I exchanged several messages and he went away and then you and I exchanged several messages and then faded away. I did see several signals on the same frequencies but they did not decode although they looked strong enough. Everything worked as expected although it is really inconvenient to have to delete what I have pre-written to change something at the beginning. These were my first two way comms.

I was able to QSO with AG4QX and three others today on V4 - 14073.0.
I received all of my QSOs with no strick-thrus. I don't know if I was received that good by others but my decodes worked great. I was running 20-35 watts today.

Amazing, mode.

Good job on the software development guys.

I was wondering how this compares with Olivia or Contesta (250/8) or (250/4).

Warren, a great meeting place for other V4 people is http://www.obriensweb.com/sked/

Depending on the time of day there are usually a lot of people there willing to test it out with you. It's a web site dedicated to all of the digital modes.

The next best thing is to put out a message here that you around for a qso. Some of the frequencies I've seen are 7073 and 14073. I would qso with you but I'm not in the shack.

73, Ron ny3j

On 12/10/2010 9:37 AM, WarrenM wrote:

I an new to this group and mode and was wondering what frequencies that the alpha testers have been using on 40m and 20m. I do not know if this was discussed before, if so I apologize in advance.

I installed it yesterday and all seems to work. I have yet to see any activity on 40 and 20 as I do not know yet where to listen. I searched all day yesterday.

If someone would tell me a frequency and time they will be on I would like to monitor to see if my setup is working.

Normally I work JT65A and Olivia modes. I am especially interested in seeing how this mode is going to work in times of emergency as I am a RACES member. After reading the specs and goals it looks to have great potential.

I am impressed with the developers (KN6JB and other) on this team as they have the skill set to pull this off.

434. Constellation Blanking Out

Yahoo group: V4Protocol
Date: 2010-12-12 16:36:17 UTC
From: Daniel V. Wolff, Jr.
Topic: 434 Message: 434

Has anyone else seen the constellation blank out? In other words, the black constellation disappears and the area filled with the same color as the program frames. This is happening here sometimes and when it is blank, I'm not able to copy any stations, even though everything in the waterfall display appears normal. As soon as the constellation reappears, I begin copying stations again. I sent a screen shot and debug logs to Rick (KN6KB) for review.

73,

We want to thank Roy for the QSO we had t(111533Z +) on 7073. Roy we appreciate your time and suggestions regarding my sig. With the exception of some QSB/QRM (I guess it's today thing, leave the AF lo, off if possible and start tuning), all of Roys xmission were 100% Q5. Thanks 73 Ed WD9DVA Greenwood, IN

From: kb4wew
Topic: 436 Message: 436

First time contact. Ray WA4BDS good solid copy about 30 min conversation. Learned a lot from him on this one. Tried to do multi station adding WD9DVA did not copy good enough but might have been a little off freq because text came in garbled but the signal strength audio I could hear was good. Next contact was WA2NBT good copy.

Enjoyed working the stations.

Hmmm..... I don't recall Rick touching this particular thread.
I'm not sure if what I am about to describes fits your own
situation with the Constellation display. I have been seeing
this particular "issue" beginning with the initial release.

I have been seeing a strange display myself but nothing that
would appear to be "blanking out." In MY case, in most cases
when stations are transmitting, little dots tend to congregate in
the OUTER CORNERS of the quadrants. No "performance"
patterns are displayed as they are in RMS Express. This
happened this morning while observing KK8G and WA4BDS
transmissions. They both had scores of in the 90s.

Now, once in a while, I notice that there are widely dispersed
little dots that tend to sparsely fill out the Constellation window.
In a few rare instances I HAVE seen "normal" displays but that
is rare indeed.

Has anyone else experienced what I'm describing? I have not
read of any "complaints" regarding something like this. I would
be a little baffled why it would happen to one station and not
to everyone else as well. So, I thought I'd report it.

441. Line Scrolling Problem (?) in Receive

Yahoo group: V4Protocol
Date: 2010-12-13 16:01:06 UTC
From: W6IDS
Topic: 388 Message: 441

Hmmmm, wonder if I found something else to report here.

While using V4 by itself, line scrolling in Receive seems to be normal.

When I bring up Windows Mail in VISTA 64, I'm seeing the scrolling
stop. I have to click on the slider to pick up the received lines.

When I drop Windows Mail. the scrolling of lines returns to normal.

Anyone else see that?

Howard,

When you bring up Windows mail is it the window with “focus”? Normally only windows that have focus are what will scroll.

Hi Howard,

What I see is the constellation display blanking out after it has been covered by an other window. If for example you drag the V4 Chat window over the constellation display. Or if you open an other full screen window covering the constellation square.

The constellation display redraws after a frame has been received.

Topic: 434 Message: 447

The constellation is currently ONLY updated When:
a.. 1) A FEC or ARQ data frame is detected and is being received. Symbols (pixels) are plotted as each symbol is received.
b.. 2) A complete constellation has been displayed for more than 3.5 seconds. It is then cleared to just the black background with red axis. This is to prevent confusion by displaying obsolete data.
I'll update this to refresh the constellation bitmap every time a repaint event it triggered (e.g. Dragging another window over the constellation)

Mel,

It seems like it should be possible...it's related to the "tightness" of the clustering of the symbols so is in someway similar to the score. The score however tries to create and absolute range (e.g. 0 to 100). To get near 100 you need a S/N about 15-20 dB (3 KHz noise bandwidth). I'll think about it some.

73,
Rick

Hi Howard,

What I see is the constellation display blanking out after it has been covered by an other window. If for example you drag the V4 Chat window over the constellation display. Or if you open an other full screen window covering the constellation square.

The constellation display redraws after a frame has been received.

Hmmm..... I don't recall Rick touching this particular thread.
I'm not sure if what I am about to describes fits your own
situation with the Constellation display. I have been seeing
this particular "issue" beginning with the initial release.

I have been seeing a strange display myself but nothing that
would appear to be "blanking out." In MY case, in most cases
when stations are transmitting, little dots tend to congregate in
the OUTER CORNERS of the quadrants. No "performance"
patterns are displayed as they are in RMS Express. This
happened this morning while observing KK8G and WA4BDS
transmissions. They both had scores of in the 90s.

Now, once in a while, I notice that there are widely dispersed
little dots that tend to sparsely fill out the Constellation window.
In a few rare instances I HAVE seen "normal" displays but that
is rare indeed.

Has anyone else experienced what I'm describing? I have not
read of any "complaints" regarding something like this. I would
be a little baffled why it would happen to one station and not
to everyone else as well. So, I thought I'd report it.

From: Phil Williams
Topic: 434 Message: 450

My experience with the constellation display has been as follows:

1. Scores of 95 or better produce a very tight pattern on the constellation display. The vector plots remain in a very small area, in each of the four quadrants.
2. Scores of less than 95. The vector plots begin to "smear". The individual vector plots tend to spread out - almost evenly filling out each quadrant. At times this smearing takes what I describe as comet w/ a tail on it. Again, any amount of smearing always drive the score down in value.

If I see smearing on received from another stations and it varies from a greater or lesser degree over the duration of the QSO, I tend to chock this up to selective fading.

If I see smearing during the xmission of my data then I suspect corruption of my TX audio (RF feedback, TX audio too hot, the usual suspects.)

I think that SNR may not be the total answer as it more of a quantitative measure while the constellation display and the accompanying score is more of a qualitative measurement. I make that case that one could have good SNR, but the signal is corrupted by selective fading, front-end overload, RF feedback and excessive TX audio.

Phil,

The score IS based on the Actual average calculation (across all symbols of a frame) of how close the demodulated symbols are to the four “ideal” corners. A score of 100 would be all symbols in the corners only. Selective fading will cause variations in the symbols moving them away from the corners but the FEC applied will recover the good data from some pretty badly smeared symbols.

If I do find a good way to display S/N it will be in addition to the score which is really the best indicator of decoding success. Scores above 50-60 will usually decode correctly.

453. Radio remains in Transmit mode after Abort

Yahoo group: V4Protocol
Date: 2010-12-13 22:47:23 UTC
From: k0uer
Topic: 453 Message: 453

The Abort command works as designed but then holds the Radio in transmit. This occurs when sending a file from the user files or from a keyboard generated transmission in FEC. This same phenom has been noticed by three others USAF MARS members while testing on our 1400Z multimode net. So far the only choice we have found for proceeding is to shut down V4.Chat and rebooting the software.
If there has been a previous post on this I missed it.

There are stats internal to the program on that + lots of things but it's probably of little value in those cluttering up the displays. The idea of the strikethrough text is it shows exactly what was received (in many cases still readable to some degree).

456. New Update 0.1.4.0

Yahoo group: V4Protocol
Date: 2010-12-14 02:12:04 UTC
From: Rick Muething
Topic: 453 Message: 456

All,

I have posted a new update. This should fix several reported problems and modifies the way the text is sent from the Keyboard window to what I think will be easier (though it is different...see below).

Please read below and the help on the main window page that explains the NEW operation of the keyboard text box and the Send file functions. This new send method (Ctrl<Cr>) is different than the simple <Cr> from before but I think will work better. Please try it for a while before giving feedback.

73 and good luck,

Rick KN6KB

V4 Chat Revision History

12/13/2010 0.1.4.0 Modify Keyboard entry to only send upon Ctrl<Cr>.
Modify File send to paste into Send text box. Not sent until Ctrl<Cr>
modify clear text and pointer updating SentTextPtr to avoid pointer exceptions
Two Tone Test button added to Setup menu to faclitate changing/checking Drive level.

V4 TNC Revision History

12/13/2010 0.1.4.0 Added Subroutine RefreshConstellation to be called on pnlConstellation_Paint event.
Added info msg box to display current drive level for manual two tone test from menu.
Abort mechanism fixed to clear blnAborting Flag and insure stopping sound card and PTT
Frequency change upon changing grid selection now logged to main log.

457. newbie question re ptt and ic7700

Yahoo group: V4Protocol
Date: 2010-12-14 04:30:19 UTC
From: vk3xl
Topic: 457 Message: 457

I have just installed v4 0.1.4.0 and try as I might I cannot get the ptt to work.

I use a home brew ci-v interface that works well with HRD and DM780 MMTTY, MMSSTV etc. But so far no luck with V4. I did manage to receive a couple of signals last night on 14.073 one was a G station and the other was a DL4. Lots of lightning static last night in VK3.
I have set the interface to com 8 (same as HRD) and the ptt to ci-v. I have played with all the available com port combinations in the drop down list with no success.
So are there any tips for where to start looking in the setup area.

I am using a usb to com adaptor that I use for HRD etc so believe it should work for V4, but it may be something to look into.

Thanks in advance

HRD works with a stereo plug because it operates in full duplex. You might try using a stereo to monaural adapter as V4 seems to like half-duplex.

Hmmmm, wonder if I found something else to report here.

While using V4 by itself, line scrolling in Receive seems to be normal.

When I bring up Windows Mail in VISTA 64, I'm seeing the scrolling
stop. I have to click on the slider to pick up the received lines.

When I drop Windows Mail. the scrolling of lines returns to normal.

Anyone else see that?

Howard,

Focus is the Windows term for “the active window”. If you have several windows open only ONE can have focus and it is usually highlighted in some way (border etc....depending on OS version). If you are using Windows Mail and it has “focus” then other windows may not update visually. There are some mechanisms around this but in general an application should not grab “focus” unless the window for that application is actually clicked.

Howard,

When you bring up Windows mail is it the window with “focus”? Normally only windows that have focus are what will scroll.

Subject: [V4Protocol] Line Scrolling Problem (?) in Receive
Hmmmm, wonder if I found something else to report here.

While using V4 by itself, line scrolling in Receive seems to be normal.

When I bring up Windows Mail in VISTA 64, I'm seeing the scrolling
stop. I have to click on the slider to pick up the received lines.

When I drop Windows Mail. the scrolling of lines returns to normal.

Anyone else see that?

Thanks Jerry,

That is definitely a bug. The logic in that part of the code is tricky (too tricky!). I'll fix on the next release.

Excellent! Thank you for all your hard work.

I notice on my installation that typing more than one <cr> on a line causes the cursor to jump up one line and delete the last character on that line.

AHHH....well, you can learn something each day. I am aware of "focus" but not conciously. Now I am. NO, Windows Mail was in focus, not V4. Gotta remember that. Select what I want as active - if writing message in Win Mail, V4 isn't gong to scroll - it is not in focus. I must have sensed that because it makes sense now.

Thanks Rick.

Howard,

Focus is the Windows term for “the active window”. If you have several windows open only ONE can have focus and it is usually highlighted in some way (border etc....depending on OS version). If you are using Windows Mail and it has “focus” then other windows may not update visually. There are some mechanisms around this but in general an application should not grab “focus” unless the window for that application is actually clicked.

☐

OOOPS! Help me out here <GRIN>

I'm reading, or trying to, about "focus" involving
such statements like -

1.. You're returned to the main window, and the focus is the Message list which contains the messages of the selected folder.
I've never given this much thought frankly.

UH. . . . my problem is that when Windows Mail is up (like it is now for this message), the Session window
in V4 Chat will cease to scroll. Once I get out of Windows Mail, the scrolling returns to normal.

I don't think I understand the relationship between V4 Chat and Windows Mail and focus.

I'm stumped!

I ad the previous version running FB with probably 8 QSOs to date

Loaded the latest version:

it will send 2 tone test and CWID, will not send text or user files. Mode set to FEC. receives OK

Actions so far:

went in and removed all files from computer and reinstalled the new version.

Rebooted the computer.
Went through set-up and ensured all was well
closed all other windows on the computer
Swore at the computer

any ideas on where I should look.... running XP

Topic: 472 Message: 472

We're lost (ran out of ideas). Working stations on 7073.0 and receiving both L&C (599). Copy all their xmissions. But when I send it's all down hill, Good signal, on freq, but the receiving stations copy just pieces of my xmissions.

Here's what we have:

Computer running xp home

Interface is a RigBlaster Plkus

The rig is a Kenwood 570 into a B&W 90 at 40 feet.

We have set the RB and the Rig both in VOX.

Output abt 60 W

V 4 ver 1030

Regarding the VOX setup, we can run w/o VOX and still copy Q5. Apparently the VOX mode either on or off doesn't matter regarding the sending of data.

We use the same setup on RMS w/o any problems. It seems like the problem began going with 1030. 1010 and 1020 appeared ok.

Any ideas? Thanks 73 Ed WD9DVA

From: Rick Muething
Topic: 472 Message: 477

Ed,

0.1.3.0 (please use complete and accurate numbers...there will be times when those are NOT all single digits) lengthened the leader by about 88 ms for both VOX and non VOX. This has no negative affect and will improve the decoding as already verified both with the simulator and over the air. VOX keying (Vox keying used if you have selected External for the VOX PTT Port in the radio setup menu) adds an additional 88 ms to the leader (to compensate for the leader lost due the VOX attack and key delays). VOX keying can be triggered either by the sound card interface (if so equipped ...like the SignaLink USB) or by the actual Radio VOX circuit (with VOX enabled). If you select a different keying mode you must set up the sound card interface, separate serial port, or use transmitter PTT control (some radios) as described in the help. I believe all this is working on 0.1.3.0 (I can't test every combination here).

Now for the other side to hear and decode you requires:
1) Your transmitter be modulated cleanly (no RF feedback) and not over driven (no ALC sending the two tone test).
2) You have a decent antenna/tuner etc
3) The receiving end has set their frequency and tuning range correctly (so your signal falls entirely INSIDE their green tuning lines).
4) They don't have local QRM or QRN that is compromising your signal too much.
5) They have their receive level set properly ("in the green").

Of course 3-5 are not under your control but that is the nature of digital comms.

If you are having trouble decoding or someone is having trouble decoding you...rather than guess the best thing is to turn on Debug logging (at both ends), run a test. Note the time UTC for the test. Send me the V4 TNC debug log files (not the standard log file) with some explanation of the problem and test. This works best if the debug log from BOTH ends is sent. This is the ONLY practical way to do debugging and will make much faster and better progress than 10 email exchanges guessing at what to try next.

Good Luck,

Rick KN6KB

Ed,

Exactly WHAT are your settings being used for V4? Specifically the PTT keying mechanism. Follow the instructions in the troubleshooting section to make sure your drive level is correct. Make sure your PTT mechanism (could be one of the 4 possible described in the help) is set up correctly. If you can’t find the problem post your V4Chat.ini file and I will take a look at it.

Chuck,
Update to 0.1.4.0 Ctrl<Cr> now sends the data. a regular <Cr> just adds a return into the text.
Also you cannot edit data already sent. Once it is sent it is sent and the keyboard entry box will NOT let you go back into that section of text to edit. Version 0.1.4.0 will let you go back and edit anything after the last Ctrl<Cr>. Please read the help on the new version for complete description.

Interface is a RigBlaster Plkus

The rig is a Kenwood 570 into a B&W 90 at 40 feet.

We have set the RB and the Rig both in VOX.

Output abt 60 W

V 4 ver 1030

Regarding the VOX setup, we can run w/o VOX and still copy Q5. Apparently the VOX mode either on or off doesn’t matter regarding the sending of data.

We use the same setup on RMS w/o any problems. It seems like the problem began going with 1030. 1010 and 1020 appeared ok.

Any ideas? Thanks 73 Ed WD9DVA

482. Ver 0140 Sometimes my TX txt comes back as RX

Yahoo group: V4Protocol

Attachments: 2 described; binary payloads are missing from this source WARC

Rick,

Running ver. 0.1.4.0. Sometimes a bit of my transmitted text comes back in the RX window as received text (Green) after what appears to be an AUTOID string containing my own call. (This is in addition to what you see in the RX window as transmitted text in blue italics.)

See attached logs at about 20:03.
(Chat log was copied earlier than TNC log, so contains more.)

Running Win7 Pro.

73, John W2KI

Howard,

I have seen the same thing - when V4 Chat is not active, receive text
stops scrolling. Once I make V4 Chat the active window, it picks up
like it has been scrolling the entire time. I figured it was just a
focus issue.

Maybe I didn't read the info correctly, but my editing follows Chuck's finding. I can delete part of a word but as soon as I try to type a correction, the typed characters are appended to the end of the line. To make a typing correction I have to backspace and erase everything following the area I wish to correct. Am I doing something wrong?

Chuck,
Update to 0.1.4.0 Ctrl<Cr> now sends the data. a regular <Cr> just adds a return into the text.
Also you cannot edit data already sent. Once it is sent it is sent and the keyboard entry box will NOT let you go back into that section of text to edit. Version 0.1.4.0 will let you go back and edit anything after the last Ctrl<Cr>. Please read the help on the new version for complete description.

John; You were doing very well here this morning on 20 Meters, almost 100% print on you and also Deme VE7CRT on 40 Meters.... Only hitch in the system I had problems with this morning was the inability to edit a misspelled word back in a line somewhere. The correction always jumped to the end of the line.
I found it much easier now to type out a one liner of text, hit <CR> and just keep going without <CR> causing a transmit before being ready. Hopefully in the future , the <Ctrl-CR> will be linked to a "TX" button like we find in Op Modes found in FLdigi.

I have been seeing the same effect in more versions than the 0.1.4. My typed text is reprinted instantly in italics in the transmit (upper) window, but then typically much of my typed text is again printed as green text. It's as though I am actually receiving my transmitted text. Typically there are gaps in the green print; they look like missed blocks. K2MJ today surmised it could be my loopback not working properly.

Any ideas? I can't find the answer in the Help file.

In FEC mode the V4 TNC ALWAYS works in full duplex. That is it can receive AND send at the same time. If you see your sent text coming back (in Green or Red strikethrough) it is because the transmit audio is finding its way back into the receive audio. Ways this can heappen:
1) You are running a true loopback test with TX audio out tied to RX audio in(levels must set correctly of course)
2) Your radio or sound card interface has some monitor mode which pipes the tx audio back to rx audio. (not many radios or sound cards do this).
3) Your sound card or sound card interface doesn't have good isolation between the send and receive channels. If the receive audio is clean it can still be received even if it is fairly weak.

If this proves to be a significant problem (I haven't seen this on any of my test installations or radios) I can disable the full duplex and only employ it for the loopback test.

Chuck,All,

I believe the latest code 0.1.4.0 is OK except for multiple plain <Cr> which I'll fix on the next time. Once you send a Ctrl<Cr> that text is essentially gone (sent to the output buffer) and it can't be edited so the code should not allow you to backspace in or otherwise enter any characters into that now "sent" text. There is no practical way to edit code while it is waiting in the output buffer...just like you can't edit an email once sent.

The idea of graying out the sent text in the keyboard directory is good ....will take some programming (working with these rich text boxes is not trivial) but I think that is a good solution that will make obvious when text can be edited in that text box.

Version 0.1.4.0: One more leftover bug. The window containing the text boxes does not keep its size and shape following a minimizing action. After the window is minimized (e.g., to see something underneath it), it returns in a much smaller size and shape and needs to be dragged again to the desired size/shape.

I doubt there is anything being mentioned about text already sent. We are talking about the info in the type ahead buffer, trying to edit that before it is sent. Therein lies the problem. Once text has been entered into the type ahead buffer, it can not be edited. You can erase parts of it, but you cannot correct a misspelled word or add text in between two words in that buffer. That is the entire meaning in the original message.
As it is now, to correct an error in the text, everything after the error must be erased before the correction can be made..

OK Chuck I follow that. Well its about 100 times easier to describe than it is to implement but I understand the need. Basically I understand the rule should be:
1) Text sent to the outbound buffer is out of bounds for edit of any type. Should be color coded/background color etc.
2) Text still in the type ahead buffer (defined as anything in the keyboard text box not yet sent to the outbound buffer) is editable in any sense. (insert, delete, backspace, cut, paste etc)
3) Ctrl<CR> places all unsent text PRECEDING the Ctrl<Cr>) to the output buffer. Any text AFTER the Ctrl<Cr> is still editable. The Ctr<Cr> itself is NOT sent.

I am also working on a mechanism to enable/disable FEC full duplex.

In FEC mode the V4 TNC ALWAYS works in full duplex. That is it can receive
AND send at the same time. If you see your sent text coming back (in Green
or Red strikethrough) it is because the transmit audio is finding its way back
into the receive audio. Ways this can heappen:
1) You are running a true loopback test with TX audio out tied to RX audio
in(levels must set correctly of course)
2) Your radio or sound card interface has some monitor mode which pipes the
tx audio back to rx audio. (not many radios or sound cards do this).
3) Your sound card or sound card interface doesn’t have good isolation
between the send and receive channels. If the receive audio is clean it
can still be received even if it is fairly weak.

If this proves to be a significant problem (I haven’t seen this on any of
my test installations or radios) I can disable the full duplex and only employ
it for the loopback test.

Subject: Re: [V4Protocol] Ver 0140 Sometimes my TX txt comes back as
RX

I have been seeing the same effect in more versions than the 0.1.4. My

typed text is reprinted instantly in italics in the transmit (upper)

window, but then typically much of my typed text is again printed as

green text. It's as though I am actually receiving my transmitted text.

Typically there are gaps in the green print; they look like missed

blocks. K2MJ today surmised it could be my loopback not working
properly.

Any ideas? I can't find the answer in the Help file.

Warren,

In the next release there will be a setting (saved in the ini file) that enables/disable FEC full duplex. The full duplex test on the TNC will temporarily enable full duplex just for the test regardless of the setting.

Thx that will be great for me!

Many of these issues you have been talking about I have had in the software I have been writing too. When a lot people use your software you get a lot comments on what is important. I have had to use a lot of variables, flags, radio buttons, and drop downs to turn on and off that is customizable to make everyone happy. Not easy and can cause your code to become spaghetti. I like to store the options in INI files others like to put in the Windows Register. Both have advantages and disadvantages. Writing good software takes a lot of time and testing. Good documentation is another skill left to the experts in the English language (hi hi - not my best skill).

Anyway doing a great job Rick.

Thx again,

73s

Rick; Your Para. 1. and 2 looks great to me. The second sentence in your para. 3 is to me contradicting para. 1. I don't see any need for editing text once it has been placed in the outbound transmit buffer, but that same text in the lower keyboard text box could be greyed out (or as you say color coded) after the <ctrl cr> to remind a user that this portion is now in the TX buffer and can no longer be edited.

Subject: Re: [V4Protocol] ARRRRRRRRRRRRRRRRGH!!
OK Chuck I follow that. Well its about 100 times easier to describe than it is to implement but I understand the need. Basically I understand the rule should be:
1) Text sent to the outbound buffer is out of bounds for edit of any type. Should be color coded/background color etc.
2) Text still in the type ahead buffer (defined as anything in the keyboard text box not yet sent to the outbound buffer) is editable in any sense. (insert, delete, backspace, cut, paste etc)
3) Ctrl places all unsent text PRECEDING the Ctrl) to the output buffer. Any text AFTER the Ctrl is still editable. The Ctr itself is NOT sent.

I am also working on a mechanism to enable/disable FEC full duplex.

The V4 signal is a standard 4FSK modulation which is phase synchronous (constant amplitude except for the two tone leader) and set at a baud rate of 46.875 baud. It looks just like it does on the V4 TNC waterfall when you are sending a FEC loopback (assuming your output audio is tied to input audio. The signal is 200 Hz bandwidth at −26 db. To be able to be decoded the ENTIRE received signal (all 200 Hz) must fit BETWEEN the green tuning lines on the V4 TNC waterfall. If you change the tuning capture range it will change the separation of the green tuning lines.

Topic: 501 Message: 502

oh wait ... my waterfall display is the converse of the transmitted signal. it is blank/black while there is modulation and greyish during the between-frame pause.

i was unsuccessful configuring rig control. PTT-only works but enabling a second CAT port kills PTT. My PTT is on COM1 and CAT on COM2. configuring COM2 produces an error message about not being able to open the port and also results in PTT not working on COM1.

I tend to think it is, Rick. IMHO, I think we're seeing a little bit of history being made here. The FEC is working such that it feels no different to me in results than what I'd see in a PacTOR I FEC QSO.

Ah, but with that said, I'm really anxious to see what develops when I get my hands on the ARQ mode. I'm expecting totally error-free comms - well, I get that now with PacTOR I ARQ, so that's my own bench mark. Someone used to the SCS product may have a different measuring stick.

Thus far, Rick et al have done good.

Yeppir, let's hook up whenever.

Rick,

How about adding an selector option in one of the pull-down menus to turn on or off the full duplex feature as an alternative to always disabling it. This way the user has the option to use full duplex or not, depending on how they may be using the program. And, if you choose this optional solution then set the default condition of the selector to duplex off (simplex).. Otherwise, disabling full duplex, except for the loop back test as you mentioned, may be necessary.

In FEC mode the V4 TNC ALWAYS works in full duplex. That is it can receive AND send at the same time. If you see your sent text coming back (in Green or Red strikethrough) it is because the transmit audio is finding its way back into the receive audio. Ways this can heappen:
1) You are running a true loopback test with TX audio out tied to RX audio in(levels must set correctly of course)
2) Your radio or sound card interface has some monitor mode which pipes the tx audio back to rx audio. (not many radios or sound cards do this).
3) Your sound card or sound card interface doesn't have good isolation between the send and receive channels. If the receive audio is clean it can still be received even if it is fairly weak.

If this proves to be a significant problem (I haven't seen this on any of my test installations or radios) I can disable the full duplex and only employ it for the loopback test.

The next release has a check box for enabling/disabling FEC full duplex. It will still temporarily toggle to full duplex if you do a FEC full duplex loopback (for testing). There is no reason to allow rapid switching back and forth of full duplex...you are either set up to use it or not.

You didn’t explain the PTT mechanism you are using and if VOX (e.g. SignaLink) if you have delay set in. For VOX (or the SignaLink USB) you want MINIMUM VOX delay or “hold”. Adjacent frames (when the output buffer has more data than just one frame) are sent only separated by about 600 ms.....I call that contiguous sending. Once the outbuffer empties there is a automatic hold off of I think 1-2 seconds before a new frame can be started and then ONLY when the busy detector sees a clear channel. You may have the busy detector set too sensitive...read the help on that.

Subject: [V4Protocol] TX/RX turnaround

i've been following the discussion here from Post #1 and haven't seen mentioned: why is there the seeming long pause between transmitting frames and especially why is the pause from the end of the last frame until the PTT unkeys the same length as in between frames? i don't have CWID enabled, in case that's relevant.

The waterfall display has a type of “AGC” in it to enahance contrast over a wider range of drive levels. When there is just “noise” it will usually show a dark-light blue speckles. A strong signal will provide brigher actual signals and if the noise is low also a dark (or black) background.

There are 4 ways to key the PTT as described in the help and I believe all 4 are working OK. Which one you use (and you should only use one) will be determined by your setup and the capabilities of the radio and/or sound card interface. Read about the PTT setup in the help.

Subject: [V4Protocol] Re: TX/RX turnaround

oh wait ... my waterfall display is the converse of the transmitted signal. it is blank/black while there is modulation and greyish during the between-frame pause.

i was unsuccessful configuring rig control. PTT-only works but enabling a second CAT port kills PTT. My PTT is on COM1 and CAT on COM2. configuring COM2 produces an error message about not being able to open the port and also results in PTT not working on COM1.

From: Guy
Topic: 520 Message: 520

Hi to all,
If I might give a suggestion, I would appreciate the copy/paste option and also the possibity to use a beacon with a text for example with the RF power used.

For info
Is it normal that I can't decode WINMOR with this "V4 TNC".
I have good contact with VE1YZ-5 on 18097.5 and RMS Express soft but when another station is on air, I can read him with "V4 TNC". I must say that VE1YZ-5 works with a "Inbound Session Bandwith" of 1600 Hz and that is maybe why it doesn't work?>>

I also sorry to observe that much of the frequencies (suggested on K3UK sked page)are busy with PSK and that is not simple to find a V4 station in this case.

Congratulation for this works, it seems to have a futur

527. New Version 0.1.5.0

Yahoo group: V4Protocol
Date: 2010-12-16 18:30:03 UTC
From: Rick Muething
Topic: 520 Message: 527

All,
I have just posted a new version 0.1.5.0 on the Yahoo FTP. You can download this and install. (You must uninstall your current version first). No settings or logs will be lost. This addresses many bugs and changes but does not YET have cut and paste functions into the text boxes. (that is fairly straightforward but will require some additional time).
Some important reminders:
1) Run the latest rev. I can't test and won't reply to problems related to prior ALPHA revs. (all ALPHA revs begin with 0.1. ... and all revs increase in number. Use the correct number (with decimal places) when identifying a revision.
2) Describe problems correctly and completely. If necessary send log or exception files directly to me at rmuethingATcfl.rr.com
3) Please do not waste your time and mine asking for cosmetic or frill functions at this stage. The objective is to FIRST get a solid and working protocol and client. There will be plenty of time later for add ons. We are only about 12 days into ALPHA testing. Good software like fine wine takes time (and focus)!
4) I am still working on ARQ but I want to get the FEC mode solid before releasing this. Its another whole can of worms!
5) Read the help file. It wastes everyone's time and if you don't even try. There are several new functional changes in this version which should be completely described in the help.
Good luck,
Rick KN6KB
Latest revision for V4Chat and V4 TNC below:
V4 Chat Revision History
...
12/16/2010 0.1.5.0 Move frequency update notice to main screen (still logged).
Fix Keyboard text to allow editing and clear out sent text.
Initialize from ini file values moved to tmrStartup to allow auto restart upon change in Setup form.
Check for window state added to resize event to fix resize after minimization.
Updated mode options to show FEC FD when Full duplex enabled.
Changed clear functions on text boxes.
V4 TNC Revision History
...
12/16/2010 0.1.5.0 Added S/N calculation (3 KHz Noise bw) to constellation. Logged to debug log.
ARQ repeat timer delay changed from 600 ms to 800 ms.(trial)
Add msg box warning of forced close on manual Force Close from Help menu.
Made provisions for Enabling/Disabling FEC full duplex.
Made Two Tone test and FEC Loopback over ride Full duplex setting during test.

528. Ctrl-enter vs. no ctrl-enter

Yahoo group: V4Protocol
Date: 2010-12-16 18:58:57 UTC
From: Kent & Shirley
Topic: 528 Message: 528

I don't know how one establishes typing habits over the years, but to me, I liked the simple "enter to transmit" feature. I liked being able to type half a sentence and if the pause between transmissions was too long, I could hit "enter" with my pinkie and keep on typing. If the person on the other end did the same, flow rate of the chat would go way up without long pauses while one person or the other typed. That's my lowly opinion and I don't know where I learned that--perhaps in the old days of HF packet keyboarding. BUT, I realize the merits of doing it with "ctrl-enter" too (even though I personally now have to pull my hands from the fast-typing position to hit two keys at once).
So how about this as a long term solution? Could there be a switch somewhere, where the op could select how he wants his keyboard to operate??---either with "ctrl-return" or just "return"?? Then both parties/opinions could be accommodated!!! That is my vote--any other opinions??? 73 de Kent AD7HK

529. Automatic restart not work

531. no audio but 2 tone test works

Yahoo group: V4Protocol
Date: 2010-12-16 20:41:25 UTC
From: KB3FXI
Topic: 531 Message: 531

I just upgraded to 1.4.0 on my Vista Home Premium computer running along with the USB Signalink. I did a control panel uninstall on the previous version 1.3.0 and installed the new version.

I'm assuming nothing changed for the transmit protocol. I'm in FEC mode, type my text and hit return, but the software doesn't go into transmit. But, the 2 tone test triggers the USB Signalink and works fine.

I did another uninstall and also removed all my previous V4 folders and reinstalled, starting from scratch. But still have the same result.

I also tried dropping a cq text file I created with the software and that won't trigger tx either.

Am I missing some sort of change in how to transmit my text in the tx text box?

-Dave, KB3FXI

532. Re: [V4Protocol] Ctrl-enter vs. no ctrl-enter

Yahoo group: V4Protocol

From: Rick Muething
Topic: 528 Message: 532

Kent,

You can do almost anything with the user interface if you want to add enough switches, setups, help files, and training courses....But ...

The switch was made from the basic <Cr> to send to allow for the ability to use and edit keyboard entered text or text files which might have a <Cr>. If you pasted in a text file that had embedded <Cr> it would make it difficult or impossible to edit).

The bottom line.... designing and implementing a GUI is a balancing act where you balance the ability of every person to design and configure (using setups, config files etc) their own unique interface with the practical reality of trying to make things consistent and being able to document them so people can learn and operate it with minimum of training and configuration hassle.

I would like to remind us all as alpha testers of some points I have mentioned before:
1) V4 is a new protocol and that protocol is implemented using the V4 TNC virtual TNC. Right now I am trying to debug and optimize the protocol. There is a lot of complex functional timing and DSP code inside that V4 TNC and it still has many bugs some known many not yet known. Once that is done you or any other software designer can incorporate that V4 virtual TNC (making it visible or not) into their own client with it's own GUI and functionality. I designed it this way because there are probably 100 x the number of programmers that can design and implement a good client type GUI as there are that can design and optimize HF radio protocols using the sound card. The same approach has worked out pretty well with WINMOR with now about half a dozen different programs using the exact same Virtual WINMOR TNC. The virtual TNC concept works very much like the physical TNCs we support with most of our other client programs.

2) V4 Chat is (right now...12 days into ALPHA testing) a vehicle to exercise the V4 TNC and test out the V4 protocol. I want to (and will try) to make it as functional and easy to use as possible. Ease of use starts out by making it consistent and minimizing the setup complexity to what is REQUIRED to get up and running. I feel strongly now is not the time to be adding unnecessary modes, operational variations, user GUI options, color choices, skins etc. While those all sound simple (and in some cases are simple) they take away from the primary goal of making the V4 protocol work reliably, be well optimized, and be well documented so others can use it to create their own clients and servers.

Someone wisely said once. "Far more software dies of indigestion than starvation." I think the two operational words we should be using 12 days into initial testing are: "KISS" and "FOCUS".

Thanks for your feedback and participation.

73,

Rick KN6KB

Topic: 531 Message: 534

Dave,

The latest version is 0.1.5.0. Please use it. There is NO support in ALPHA and BETA testing for back revs....My support staff of application engineers and programmers (Ha!) is too small!

Then read the help files, AND/OR the Revision history files, AND/OR the message I send out with every new update. These explain and document the changes. This is ALPHA testing and changes in functionality and features are the NORM not the exception. Please try and get into the habit of reading about changes in the above documents before writing to the reflector.
73 and good luck,

Rick KN6KB

Thanks Berndt,
I probably did not initialize a new instance of the Radio control module correctly after a save of parameters to the INI file.... While it is conceptually simple implementing all the changes in setup without a true program restart is not always easy. I can probably get that fixed on the next rev.

I've had very good success with version 0.1.5.0. One thing I've noticed that I don't recall in the other versions is when I am sending I'm seeing my signal in the waterfall. This keeps the channel busy until the waterfall is completed and delays the quad message from being sent. I guess this isn't a big deal but it does slow down QSO progress somewhat.

I'm observing about a 1 second delay in switching back to RX from TX after the output buffer has emptied. I have monitored my transmissions using a second receiver to perform my observations.
I have set V4 AutoID off and have both enabled and disabled CWID.

My transmitter remains in TX mode with no modulation for about 1 second before the PTT is released and it returns to RX mode. The busy detector would seem to not be involved since there is not even enough audio level to cause the waterfall to go any brighter than grey while still in TX mode.

I am using serial port signaling on COM1 for PTT (RTS in this case) and serial data on COM2 (9600n1 RTS/CTS) for CAT. No VOX, no PTT derived from VOX.

The previously reported COM2 error appears to have been a transient, although changing the Radio Control Port from [None] to COM2 causes V4 to "forget" its PTT Port setting (it switches to [External]).

Is there a way to embed a Ctrl-Enter or its equivalent into a User File?

> You didnâ□□t explain the PTT mechanism you are using and if VOX (e.g. SignaLink) if you have delay set in. For VOX (or the SignaLink USB) you want MINIMUM VOX delay or â□□holdâ□□. Adjacent frames (when the output buffer has more data than just one frame) are sent only separated by about 600 ms.....I call that contiguous sending. Once the outbuffer empties there is a automatic hold off of I think 1-2 seconds before a new frame can be started and then ONLY when the busy detector sees a clear channel. You may have the busy detector set too sensitive...read the help on that.

Howard,

Nothing there to indicate any changes from the what was being used in previous version.
0.1.2.0, 0.1.3.0 and 0.1.4.0 all keyed fine
using same set up as currently selected in 0.1.5.0.

This is the first version in a long time I've had any real trouble with.

Will keep looking I guess.

545. 0.1.5.0 version

Yahoo group: V4Protocol
Date: 2010-12-17 03:19:52 UTC
From: Jack Swift - Swift Hardware
Topic: 539 Message: 545

just installed 0.1.5.0
no problems (didn't expect any)
i like how the <ctrl><cr> works - it allowed me to type several
'separate' lines and then go back and fix my typos on each line..

however... i noticed two things that 'remain'

1. the 2-tone test had my 756pro3 meter at 50watts but when i sent a
'message' it showed 25watts. this seems similar to winmor...
2. the receive window always has some 'undecodable' (red with
strikethrough) text - it just 'grows' slowly but surely. - this is 5
minutes worth:
++++++++++++
`0C<9 :\UdJi
"p i!H0⋆'#}O$H]@V=- `c hd
++++++++++++
there is some olivia on the frequency (army's KAG) intermittantly, but
it doesn't appear to be the cause. i doubt if anyone else is using KAG
for v4chat, so it must be 'static' that the program is trying to
decipher. (like me listening to one of my ex-wives <G>!)

548. Re: [V4Protocol] 0.1.5.0 version

Yahoo group: V4Protocol
Date: 2010-12-17 03:52:20 UTC
From: W6IDS
Topic: 539 Message: 548

OK, well the Help Info is pretty well complete - Rick et al have done
a pretty good job with the docs all things considered. This is true
also for the version releases - pretty good explanations in his follow
on messages relating to the software uploads.

Now, that said - I installed v 0.1.5.0 and it went seamlessly. Back
on line with no probs keying.

The indication of the *** Freq Changed 7073.00 Khz Dial" is kind of a
nice touch me thinks.

I'm still checking to see how this version does immediately upon sending
something like one of my user files. I notice that, as in v 0.1.4.0 too, that
you MUST be sure to have your li'l slanted cursor thingie at the end of the
text you're gonna put in Que to transmit with CTRL <ENTER>. If it isn't,
you won't transmit. You have to click at the end of the text if you're not
sitting there already. I notice that this happens sporadically - I'll have to
pay closer attention to that to verify how/wnen.

I also notice that HERE, I'd be in FEC mode of course. When I go to
Setup and diddle with something and then UPDATE, the update goes fine,
things recycle, and when all's done, I find that at the top of V4 Chat window
it shows Mode: FEC, but down in V4 Sound Card TNC it will show
V4 Mode: MON.

I saw this three times and each time when I went back to V4 Chat window,
clicked on Mode and reselected FEC, the TNC changed to V4 Mode: FEC
properly.

I'm not clear as to whether or not that's as it should be. I didn't notice in the
Help file but will look again - just something I noticed.

550. V4 on long distance VK-ON

Yahoo group: V4Protocol
Date: 2010-12-17 12:11:33 UTC
From: on30digimod
Topic: 550 Message: 550

The V4 FEC mode seems to work quite well on long distance.
Today I worked again with Mike VK3XL on 14073 at 10:50Z long path wich is about 23300km.
Score was 88 S/N 1. I could still copy CQ's from Mike at 11:45Z with score 50 S/N -4.

14.073 is usually a very busy frequency, PSK moving up from 14070, Feldhell and Olivia.
Also some deliberate qrm,I guess, from people who don't know about the new mode.

What do others think about moving to other frequencies to test V4 ?

Congratulations and many thanks to Rick and the V4 team.

73

From: Rick Muething
Topic: 501 Message: 552

Chris,

That should not be...The PTT should release almost immediately (about 20-50 ms) after the end of the TX audio. (Note : those using sound card VOX need to have their DLY set to minimum...but this doesn't appear to be Chris's problem.

Chris if you can please enable the V4TNC debug log. Run a test where you see this PTT hang (is it every time?) and send me the debug log directly to rmuethingATcfl.rr.com

Re the embedded Ctrl<Cr> : A good point. I will look at this and see what can be done. Since the user files are generated by a standard utility (e.g. notepad, word pad, word etc) it has to be made using a character that can be keyboard entered (basically a printing character) or string of printing char e.g. something like "~" or "###". When the file text is then loaded into the keyboard text box the special char or string would be replaced by Ctrl<Cr> and trigger the send to the output buffer. I'm inclined to use a string like "###" not likely to ever occur in normal text. Any comments out there on this?

Kirk,

You can’t see your own signal in the waterfall unless:
1) You have FEC full duplex enabled (this is always enabled for the loopback and Two tone tests but otherwise is what is now set in the V4Chat setup menu)
AND
2) You have the transmit audio getting into the receive audio (via audio patch, acoustic feedback, VAC feedback, radio monitor function (some radios), or just plain signal leakage from the sound card or sound card interface.

You should be able to avoid seeing the waterfall during transmit simply by unchecking FEC full duplex.

Rick KN6KB

Rick,

FLDigi uses <TX> in the macro text files just for this purpose and <RX> to start the receive in a macro/text file. In other words <TX> at the end of your text file would trigger the PPT.

557. Re: [V4Protocol] 0.1.5.0 version

Yahoo group: V4Protocol
Date: 2010-12-17 14:38:51 UTC
From: Rick Muething
Topic: 539 Message: 557

Jack,

The two tone test delivers a peak waveform (two tone) with a RMS value (what you would get with a average reading watt meter) of 70.7% of the peak. E.g. 70.7 watts on a 100 watt PEP transmitter. Beyond that level (70% of PEP output) you can start to get flat topping of the two tone (used for the leader) which could cause splatter or ALC.

The data segment uses a single phase synchronous one of 4 tones sent at 70% of the peak of the two tone peak. This has no amplitude modulation so its average is also 70% or 70 watts.

So if you set the two tone for 70% of your rated PEP output the average reading wattmeter should read a constant 70% for both leader and data. Another way of saying this is the crest factor of V4 is a constant 1.41.

The level of the data signal COULD be safely (no transmitter over drive) increased to 100% of PEP but that could pose an over temp risk to most ham radios when sending long files so I chose to limit it to 70%. It would however give about 1.5 dB stronger signal at the receive end which would yield slightly better decoding but wouldn’t improve the leader detection.

The red printing on an open channel is a tradeoff. The threshold for leader detection and sync detection are all numbers...how good is the leader and how “close” is the sync symbol string. Setting that threshold will take some optimization (I would rather it not be a user set limit for a number of reasons). The tradeoff is suppress all (well at least most all) open channel “printing” but also reduce the sensitivity to copy very weak V4 signals. Right now it is set to capture about 90% of the V4 frames on a multipath path poor channel at −5dB. (a pretty poor signal). One possibility is to “gang” the decode “threshold” to the busy detector “threshold” allowing some user control. I’ll have to experiment with that. If it looks promising I’ll include it in a later rev.

Subject: [V4Protocol] 0.1.5.0 version

just installed 0.1.5.0
no problems (didn't expect any)
i like how the <ctrl><cr> works - it allowed me to type several
'separate' lines and then go back and fix my typos on each line..

however... i noticed two things that 'remain'

1. the 2-tone test had my 756pro3 meter at 50watts but when i sent a
'message' it showed 25watts. this seems similar to winmor...
2. the receive window always has some 'undecodable' (red with

strikethrough) text - it just 'grows' slowly but surely. - this is 5
minutes worth:
++++++++++++
`0C<9 :\UdJi
"p i!H0*'#}O$H]@V=- `c hd
++++++++++++
there is some olivia on the frequency (army's KAG) intermittantly, but
it doesn't appear to be the cause. i doubt if anyone else is using KAG
for v4chat, so it must be 'static' that the program is trying to
decipher. (like me listening to one of my ex-wives <G>!)

Warren, Jack,

Either of your solutions are fine. I tend to like the <TX> as it is pretty self explanatory and not likely to be found in any embedded text. We need to remember that this is only for pre configured brag files that you want to auto send so it isn't something you are doing a lot with every QSO... Requiring 4 keys "<TX>" at the end of the file seems pretty reasonable.

I'll plan on adding that and we see how it works.

Rick: I suggest the simple, indicative, but even more "crazy" string:
++t+ This don't normally occur, and doesn't involve the shift button.

We used it for 15 years here in Synapse 1, for live "through packet radio" switching directions on a live pactor, amtor or gtor arq link and also fec link.

This was for remote indicating a command to the SW to execute a typical KAM+ command normally locally involving the ctrlbutton. Thus executing transmit, receive, disconnect, abort wihtout accidentally breaking the link by error. The commands were easy to learn.

We used on the fly: ++t+ ++r+ ++d+ ++a+ ++btu+

executing ctrlT ctrlR ctrlD ctrlA ++btu+ even inserted automatically: <URcall de MYcall btu> and then changed from ISS to IRS when buffer empty.

As an extra condition, the string had to be first on a new line.

So a normal Enter was done first, then the special string.

This solution never imposed any problem, and the sequence could even be transmittet as part of the text, just avoiding it beeing the first on a new line.

We even used --setf- --getf- and other similar created commands to execute "non KAM commands" f.ex changing frequency, checking frequency of the system via the remote live packet connection for execution on another port for rig control, or switching relays etc...

Just a suggestion.

> Re the embedded Ctrl<Cr> : A good point. I will look at this and see what can be done. Since the user files are generated by a standard utility (e.g. notepad, word pad, word etc) it has to be made using a character that can be keyboard entered (basically a printing character) or string of printing char e.g. something like â□□~â□□ or â□□###â□□. When the file text is then loaded into the keyboard text box the special char or string would be replaced by Ctrl<Cr> and trigger the send to the output buffer. Iâ□□m inclined to use a string like â□□###â□□ not likely to ever occur in normal text. Any comments out there on this?

Adjacent frames (when the output buffer has more data than just one frame) are sent only separated by about 600 ms.....I call that contiguous sending. Once the outbuffer empties there is a automatic hold off of I think 1-2 seconds before a new frame can be started and then ONLY when the busy detector sees a clear channel. You may have the busy detector set too sensitive...read the help on that.

Topic: 537 Message: 560

Hey Rick,

How about this?

I have the FEC Full Duplex NOT checked or enabled.

After Updating and resetting, and resetting the Sound Card TNC from
MON to FEC again, when I transmit, I see myself in the waterfall.

V4 Chat says Mode: FEC, V4 Sound Card TNC (in Standby) says
"V4 Mode: FEC" which changes to "V4 Mode: FEC FD".

V4 Chat continues to display Mode: FEC at the same time.

Does my description relate to this thread?

Subject: Re: [V4Protocol] New release

Kirk,

You can’t see your own signal in the waterfall unless:
1) You have FEC full duplex enabled (this is always enabled for the loopback and Two tone tests but otherwise is what is now set in the V4Chat setup menu)
AND
2) You have the transmit audio getting into the receive audio (via audio patch, acoustic feedback, VAC feedback, radio monitor function (some radios), or just plain signal leakage from the sound card or sound card interface.

You should be able to avoid seeing the waterfall during transmit simply by unchecking FEC full duplex.

I know a few stations that have used 7037.0 USB in Region 1, instead of 7073.0 USB as used in Region 2. The frequency 7037.0 seems to be a compromise to get below the SSB, RTTY, and other digital modes and yet above the PSK31 stations. However, the PSK31 stations, if it's crowded, keep the "BUSY" detector active on V4-Chat. The lower section of 40 meters in Region 1 is pretty compact and finding a clear frequency can be difficult in Region 1 but others may have a better suggestion. The only stations I've heard so far on 80 meters in Region 1 were around 3587.0 USB but somebody may have an input on this too.

567. Soundcard error and recovery

Yahoo group: V4Protocol
Date: 2010-12-17 17:15:46 UTC
From: kb3cs
Topic: 567 Message: 567

on the order of about once per hour, the following exceptions are logged:
2010/12/17 10:22:39 [0.1.5.0] [V4Interface, tmrPoll Tick] Sound card data capture failure.
2010/12/17 10:22:40 [0.1.5.0] [V4Interface, tmrPoll Tick] Capture device Restart Successful.

the TNC doesn't crash and remains running all night despite the logged exceptions and the soundcard level controls remain as I set them, but the soundcard operation changes to some internally stored default settings it seems upon being Restarted. I must nudge both input and output levels and turn on and back off the AGC each time this happens. WINMOR has the same behavior on soundcard Restart, as I recall.

could V4 Chat capture soundcard settings and reassert them after performing a Restart? a sort of configuration save and restore?

Yes, yes! We seem to have a consensus that all digital modes are USB on all bands now, so I would hope we don't have to argue over it again each time a new digital mode comes along. Even tho RTTY used to be LSB on all bands, but now all the RTTY software allows for inverting the AFSK tones so that the radio can be left in USB all the time. The only one I know of that is left on LSB as a standard is Clover, and you don't hear much Clover anymore.

Jim, that was my understanding all along. That is, all digital modes should use USB on all bands these days. I only suggested LSB because others had done so elsewhere.

So from now on I will only use USB. Also from now on I will announce activity and arrange skeds through Andy's page:

http://www.obriensweb.com/sked/

rather than clog up this list.

Hello all. Here are active stations at least OH5RM, OH3NJC, OH7JJT and me. Most we are on 3590 USB weekends. I have just now my 1st QSO with om Jouko OH5RM.
First observations: I have soundcard slide settings as WINMOR mode but TNC drive level must be set 83 so output power is is only abt 15W from myÃ¶ JUMA TRX2A & JUMA PA-100, max is 150W!
With these setting OH5RM can copy me 100%, more power set by drive level: NIL.
BTW is use QuickMix so easy soundcard set for different digi modes.

I have been using V4 for nearly 1 week and although quite a few qso's many are spoiled by the BUSY N comming on. Somtimes even with a strong V4 signal the BUSY N appears and stops reception of the V4 signal. I have tried putting the "busy detector squelch" up to 10 and also reducing the RF gain on the rig but it does not make much difference. Is it possible that the strong V4 signal is being overdriven ? and thats why the TNC thinks it is not V4 and puts the BUSY N up !

The log files are in the subdirectory \Logs under the installation directory. There is no .ini file defined path.

Ian,

thanks for the feedback. The busy detector width is a function of the tuning range selected (the auto tuning should auto tune anyhing between the green lines so that is basically what is used as the limits of the busy detector. There is of course some round off error as well sensitivity to spill over so I can probably pull them in somewhat still making the busy detector range a function of the tuning (not a fixed value from center frequency).

There are many factors and parameters that determine the overall weak signal detection and It will take some time to work on this. The HF simulator I have only takes the signal down to −5dB S/N (3 KHz noise bw) so some of these tests and optimizations have to be done on air which makes it more difficult (they aren't repeatable).

From: Rick Muething
Topic: 572 Message: 583

Phil,

The Noise is actually measured (using the four 4FSK bins) which is about 200 Hz bw but I am “fudging” the reported S/N number to match the S/N output of my HF simulator which claims to be 3 KHz Noise BW. Usually CCIR S/N channels are referred to 3 KHZ noise bw so I used that for consistency. The readout on the constellation does track my simulator output fairly well over the range –5 to +15 dB.

I am the new kid on the block and still waiting for hear a V4 signal. Been watching the K3UK Digitalradio sked page, but have been at work all week, and not home during most of the activity. Also living on the US west coast has me out sync time wise. Most have gone to bed by the time I got home from work.

It is Saturday and I should be able to listen for signals. Currently parked on 14.073 USB dial frequency and hope to simply decode some signals.

I use a FLEX-5000A and VAC 4.9 and am no stranger to sound card modes. I didn't participate in the WINMOR roll out as I am not interested in email or messaging. But I do like the keyboard to keyboard modes and some JT-65A.

V4 looks like it could fill the void between JT-65A and the more conversational modes.

587. Re: 40m/80m frequencies in Region 1?

Yahoo group: V4Protocol
Date: 2010-12-18 17:23:26 UTC
From: Vegie.Wolff
Topic: 549 Message: 587

Hello Howard.

We shall see; coexistance is what we must live with. Of course there are few CW stations above 7035 in Region 1. RTTY and other digital modes are often around 7040 and higher. SSB stations fill the rest.

It's hard to find a nice clear dedicated frequency in Region 1 for one mode without experiencing interference from another mode. The PSK31 stations around 7035 seem to be there anytime the band is open and are about the only mode that has found a default "home" frequency.

I wish we had the extra spectrum as Region 2 does but we are very lucky to have gained the additional 100 KHz recently---and are grateful.

> I know a few stations that have used 7037.0 USB in Region 1, instead of 7073.0 USB as used in Region 2. The frequency 7037.0 seems to be a compromise to get below the SSB, RTTY, and other digital modes and yet above the PSK31 stations. However, the PSK31 stations, if it's crowded, keep the "BUSY" detector active on V4-Chat. The lower section of 40 meters in Region 1 is pretty compact and finding a clear frequency can be difficult in Region 1 but others may have a better suggestion. The only stations I've heard so far on 80 meters in Region 1 were around 3587.0 USB but somebody may have an input on this too.

Ian,

On the next rev I'll reduce the busy detection search to about the center 75% of the tuning range (between the green lines). You can't arbitrarily reduce the tuning range too much as that is what handles the offset from the connecting station and normally should be about +/- 60 to +/- 100 Hz. Using the 75% would then search about 300 Hz (+/-150 Hz from the red center line to determine if the channel is busy. That is a sizeable reduction from the current search of approx +/- 230 Hz from the center line. This should eliminate busy tripping from signals close to the active area (green lines).

592. V4Chat 0.1.6.0 Full Install

Yahoo group: V4Protocol
Date: 2010-12-18 19:19:10 UTC
From: Rick Muething
Topic: 580 Message: 592

All,

I have uploaded a new full install which has some important changes including some experimental ones. The Main changes are summarized below and also integrated into the new help and Revision history files.
Main changes:
1) Reduction of busy detect range to ~ 75% of spectrum between the green tuning lines.
2) Ganging of squelch setting on V4 TNC to also affect leader and sync detection (can be used to increase sensitivity or reduce open channel printing)
3) Change User File Send to User File Paste, and User file Paste and Send. “Paste” works like the prior “Send” appending the file text to the keyboard text box. “Paste and Send” appends the text and also sends it (the equivalent of a Paste, followed by a "Ctrl<Cr>). (Saves keystrokes and does not require editing the file to “auto send”).
4) Fix logic problem with Radio control and com ports.
5) Fix logic problem where mode was not being reset on the V4Chat menu upon startup.

Your feedback on these fixes is appreciated.
I will try and spend some time next week working on some sensitivity enhancements but have a lot going on as I’m sure you all do too.

73,

Rick KN6KB

V4 TNC Revision History
12/18/2010 0.1.6.0 Modify Protocol.ThreshDetect to use threshold based on V4 TNC "threshold" control and trip on roll back of correlation value.
Make treshold for sync detection (Protocol.ProcessSymbol) a function of "threshold" control.
Reduce busy detection range to ~ center 75% of green tuning bars

V4 Chat Revision History
2/18/2010 0.1.6.0 Fix shut down and restart of objRadio to close all open com ports and initialize with new parameters.
Save main size/location in .ini upon update of parameters and restart from .ini.
Set startup mode and menu to MON upon restart.
Change user file menu to allow Paste to Kbd text or Paste to Kbd Text and auto send.

I have uploaded a new full install which has some important changes including some experimental ones. The Main changes are summarized below and also integrated into the new help and Revision history files.
Main changes:
1) Reduction of busy detect range to ~ 75% of spectrum between the green tuning lines.
2) Ganging of squelch setting on V4 TNC to also affect leader and sync detection (can be used to increase sensitivity or reduce open channel printing)
3) Change User File Send to User File Paste, and User file Paste and Send. “Paste” works like the prior “Send” appending the file text to the keyboard text box. “Paste and Send” appends the text and also sends it (the equivalent of a Paste, followed by a "Ctrl<Cr>). (Saves keystrokes and does not require editing the file to “auto send”).
4) Fix logic problem with Radio control and com ports.
5) Fix logic problem where mode was not being reset on the V4Chat menu upon startup.

Your feedback on these fixes is appreciated.
I will try and spend some time next week working on some sensitivity enhancements but have a lot going on as I’m sure you all do too.

73,

Rick KN6KB

V4 TNC Revision History
12/18/2010 0.1.6.0 Modify Protocol.ThreshDetect to use threshold based on V4 TNC "threshold" control and trip on roll back of correlation value.
Make treshold for sync detection (Protocol.ProcessSymbol) a function of "threshold" control.
Reduce busy detection range to ~ center 75% of green tuning bars

V4 Chat Revision History
2/18/2010 0.1.6.0 Fix shut down and restart of objRadio to close all open com ports and initialize with new parameters.
Save main size/location in .ini upon update of parameters and restart from .ini.
Set startup mode and menu to MON upon restart.
Change user file menu to allow Paste to Kbd text or Paste to Kbd Text and auto send.

Rick got it to do it....from a TNC (V4 Mode : FEC FD) and I did a setup and changed the BW 100 hz and did an update and changed it to 200hz with an update the mode change to TNC showed (V4 Mode: Mon) and the Tx window was not grayed out.
Hope thats better info.

I parked the rig on 14.073 for awhile and heard KA1GMN, Phil in TX a few times. I'll have to try the WB4MAK site. I also could leave my rig and PC on while at home and check it out remotely. I've heard some variants of VNC work better than Remote Desktop when sending graphics like a waterfall. Not sure I'm ready to tx at first, but only monitor.

Perhaps I'll try txing on V4 this weekend. I am especially interested in ARQ when it is ready. Haven't used an ARQ mode since AMTOR in the late 80s. It was a lot of fun, but V4 is s lot faster. Never liked PACTOR because it was all mailboxes.

Howard,

I believe the constellation display is working normally (it’s a function of S/N and other distortions). On the simulator at S/N of +10 or more it reduces to a virtual “dot” in each corner.

I am now evaluating a mod that plots and computes the “distance” in the constellation as power vs signal voltage (essentially squaring the voltage) and this appears to give better decdoding (since the decoding is based on the “distance” from an ideal corner. But I need to run several hundred frames over a controlled and repeatable channel to confirm this.

600. Contacts editor

Yahoo group: V4Protocol
Date: 2010-12-19 13:53:20 UTC
From: w2ki
Topic: 600 Message: 600

It's small potatoes right now, but something to consider down toward the bottom of the list.

When you edit a contact it creates a new entry with a new timestamp. It would seem to make more sense if the original were just updated with the modified information and left with the original timestamp? Is this possible? Also, an ability to modify the timestamp would be useful.

As I say, much later on down the road......

Thanks,
John W2KI

601. Missed frames?

Yahoo group: V4Protocol
Date: 2010-12-19 14:00:15 UTC
From: w2ki
Topic: 601 Message: 601

Is it just me, or is anyone else seeing more totally missed frames lately?

There are times when signals are strong and scores good, but some frames seem to be dropped completely whereas earlier on I saw more frames with red strikethrough.

I am now running 0160, but had the same feeling in the last version or so.

(BTW I am now running in "half duplex" mode to eliminate the echo of bits of my own outgoing text. Not from Monitor mode in the radio, as it's there even with it off, so any incoming echo must be from the SignaLink USB. I wonder if "half duplex" might be a cause of missed frames. I'll have to do more testing.)

602. Why the pauses in FEC mode?

Yahoo group: V4Protocol
Date: 2010-12-19 14:08:37 UTC
From: w2ki
Topic: 602 Message: 602

As I sit here chatting in FEC and listening to the banging of the relay in the SignaLink USB as the transmitter goes in and out of TX, it got me wondering about the reasons behind the breaks in the FEC transmission between each frame. They're certainly needed for ARQ, but do they serve a purpose in V4 FEC?

Just curious.

John,

Thanks for the QSO on 20 meters today. I have duplex set and I don't get an echo of my transmissions. I only get the echo if I turn on the monito feature of my radio, Flex 3000.

I also noticed missed frames instead of text with errors with red strikethrough like other versions.

John,

The full duplex won’t change the decoding... There have been changes and I may have made too aggressive an adjustment. Right now I am evaluating some changes but testing over several hundred frames at low S/N levels on poor channels.

Hello Back Rick (and Hoby KK8G too)

I included Hoby also since he asked what I meant by "normal."

I'm asking because I am not getting what I call "normal" activity as compared to the display
I get in RMS Express. I have no "artsy" displays as it were - just (as I've written before) a massing of little dogs at the outer corners of each quadrant box in the Constellation window.

If the Score is 100, as with MY signal, the dogs merge into a SINGLE dot.

As the score reduces with a station, the dogs begin to "venture about the quadrant a little."

As the score goes lower, the dots continue to spread out and mingle.

At no time do I get the type of "information display" as with RMS Express.

Hmmmm, the lower the score the more active the dots across the face of the Constellation. If you look at the past information written about RMS Express/WINMOR, there have been depictions of the Constellation display in action. I had that in RMS Express, I do not have it in V4 Chat from the first release.

I was wondering if anyone else is experience this also? I have not seen reference to any "switchable" setting for it sooooo......

609. Experiences Operating V4 (subtitle: this is a mess, I think?)

Yahoo group: V4Protocol
Date: 2010-12-19 15:27:13 UTC
From: aa777888athotmaildotcom
Topic: 609 Message: 609

Now back from a bunch of business travel and catching up on the entire V4 thing.

No sweat installing, adjusting or using it mechanically. With fully tuned up RMS Express and RMS Winmor installations it took all of 5 minutes to get things rolling.

Now for the "messy" part...

So I've been on 20M, on everyone's favorite frequency, 14073, a few times now, and it's a mess. Nobody is using prosigns, carriers drop in and out, people are hearing one side of a QSO and not waiting until it is finished. It's crazy! It almost seems like everyone who is trying out V4 has no experience whatsoever with other, more common digital modes like RTTY, PSK31, Olivia, etc. Either that or they are in such a frenzy to make a contact with the new mode they've lost all sense of operator decorum.

Things are very confusing because

1. Nobody is prepending or appending "yourcall de mycall" to each transmission, perhaps because there is no macro capability to do this and everyone has gotten too lazy to type it manually.

2. Nobody is terminating each transmission with a "K" or "KN", or using "SK" when a QSO is finished.

3. The FEC mode forces you into one of two modes. Either you are hitting ctrl-CR after each sentence, or, more traditionally, you are typing a whole bunch of stuff and then hitting ctrl-CR. In the first case the way the protocol works there are a lot of short periods of dead air (no carrier). In the second case, without the assistance of macros, there is a ton of dead air in between each transmission. In both cases this leads to much confusion about whether the frequency is in use or whether your contact has, for some reason, become unreachable.

It's item 3 above that is the biggest issue. Rick--is it your intent that multiple people on the same frequency should just type in a stream of consciousness fashion, hitting ctrl-CR frequently, and let the auto-id and busy detector sort it all out? In other words a sort of on-air chat room? If that is not the intent, and I suspect it is not because doubling can not be prevented this way, I suggest changing the protocol and the software to keep the carrier up between buffer fills with some sort of idle pattern. Start the first buffer going with a ctrl-CR, then fill the buffer on each CR, and terminate the last buffer with a ctrl-CR. This will provide a more traditional look and feel on the waterfall. Either that or people have got to learn to use and wait for the K's and SK's.

v/r

Scott

Topic: 600 Message: 610

It is a little extra work, but you can edit one section at a time without making another entry. Will work until the process is speeded up. Just click on the line where you wish to make a change. Pause slightly, then click again in the box you wish to change. Make any change you wish, hit enter and away you go, with the entry edited to your desires.. My keyboard isn't really good on spelling so I have to do this quite often after a contact, or I wait till I'm thru with the contact and add the info, then I have to correct the date group..

625. Re: Experiences Operating V4 (subtitle: this is a mess, I think?)

Yahoo group: V4Protocol
Date: 2010-12-19 20:19:30 UTC
From: la7um
Topic: 609 Message: 625

Scott, At the time beeing I guess the important issue must be the protocoll and robustnes issue only. I concur with all you say, but bells and wistles in the program might come in handy later.

Since this is intended to be a qso mode, obviously the behaviour of the qso participants needs to be "refreshed" and aided by the program.

This is quite something else than running an automatic pactor/winmor BBS or RMS

One good tool might absolutely be your suggestion of macros, f.ex by using the function tabs, or on the fly text released macros kind of as I described in msg 559, which could either be be enbedded in a text, or be used directly from a keyboard as it originally was used some 15 years ago in a home made SW but reported used WW.

Intention at that time was running a keyboard qso on HF amtor or pactor or fec and turning link directions, by operating packet from a remote site. (Or even the other way around)

I paste in part of that posting.
Look spesifically on the macro BTU released by the sequence ++btu+
That command always automatically identified properly both participating stations.
The disconnect also identified the disconnecting station.
.....
>snip:
Re: TX/RX turnaround

Rick: I suggest the simple, indicative, but even more "crazy" string:
++t+ This don't normally occur, and doesn't involve the shift button.

We used it for 15 years here in Synapse 1, for live "through packet radio" switching directions on a live pactor, amtor or gtor arq link and also fec link.

This was for remote indicating a command to the SW to execute a typical KAM+ command normally locally involving the ctrlbutton. Thus executing transmit, receive, disconnect, abort wihtout accidentally breaking the link by error. The commands were easy to learn.

We used on the fly: ++t+ ++r+ ++d+ ++a+ ++btu+

executing ctrlT ctrlR ctrlD ctrlA ++btu+ even inserted automatically:
<URcall de MYcall btu> and then changed from ISS to IRS when buffer empty.

As an extra condition, the string had to be first on a new line.

So a normal Enter was done first, then the special string.

This solution never imposed any problem, and the sequence could even be transmittet as part of the text, just avoiding it beeing the first on a new line.

>snip
.
.
Other commands were available as well.
.
.

> Now for the "messy" part...
>
> So I've been on 20M, on everyone's favorite frequency, 14073, a few times now, and it's a mess. Nobody is using prosigns, carriers drop in and out, people are hearing one side of a QSO and not waiting until it is finished. It's crazy! It almost seems like everyone who is trying out V4 has no experience whatsoever with other, more common digital modes like RTTY, PSK31, Olivia, etc. Either that or they are in such a frenzy to make a contact with the new mode they've lost all sense of operator decorum.
>
> Things are very confusing because
>
> 1. Nobody is prepending or appending "yourcall de mycall" to each transmission, perhaps because there is no macro capability to do this and everyone has gotten too lazy to type it manually.
>
> 2. Nobody is terminating each transmission with a "K" or "KN", or using "SK" when a QSO is finished.
>
> 3. The FEC mode forces you into one of two modes. Either you are hitting ctrl-CR after each sentence, or, more traditionally, you are typing a whole bunch of stuff and then hitting ctrl-CR. In the first case the way the protocol works there are a lot of short periods of dead air (no carrier). In the second case, without the assistance of macros, there is a ton of dead air in between each transmission. In both cases this leads to much confusion about whether the frequency is in use or whether your contact has, for some reason, become unreachable.
>
> It's item 3 above that is the biggest issue. Rick--is it your intent that multiple people on the same frequency should just type in a stream of consciousness fashion, hitting ctrl-CR frequently, and let the auto-id and busy detector sort it all out? In other words a sort of on-air chat room? If that is not the intent, and I suspect it is not because doubling can not be prevented this way, I suggest changing the protocol and the software to keep the carrier up between buffer fills with some sort of idle pattern. Start the first buffer going with a ctrl-CR, then fill the buffer on each CR, and terminate the last buffer with a ctrl-CR. This will provide a more traditional look and feel on the waterfall. Either that or people have got to learn to use and wait for the K's and SK's.

629. [0.1.6.0] Waterfall does not work with VAC

Yahoo group: V4Protocol
Date: 2010-12-19 21:17:33 UTC
From: Ian Wade G3NRW
Topic: 629 Message: 629

[0.1.6.0]

I am trying to connect my SDR-IQ to the V4TNC via VAC 4.09. As I tune the receiver across strong signals I can see the "Rcv Level" indicator move backwards and forwards, but nothing appears on the waterfall -- it is completely black (except for the tramlines).

Has anyone else tried VAC?

(P.S. If I connect the SDR-IQ to the V4TNC using real audio cables, it works beautifully. Being able to set up a brick-wall audio filter of any bandwidth is wondrous indeed!)

FWIW, I am using the same version of VAC, but with a FLEX-5000A and PowerSDR and have no waterfall problems w/ 0.1.6.0. It is not the same SDR setup you have.

Also, do you completely uninstall V4 before installing the new version? I am not sure if you need to delete any of the files and subfolders in C:\V4Chat, before reinstalling. I haven't so far. Just a thought...

Hi Steve

The VAC works with SDR-IQ and fldigi, so I would expect it to work with the V4TNC as well. More investigation called for, I guess.

Yes, I did Add/Remove 0.1.5.0 before installing 0.1.6.0 -- in fact, it won't let you install a new version if there is already an older version in place. However, I didn't manually remove the old files under C:\V4chat, as I understood it was not necessary to do so.

i merely use the windows start>control panel>add and remove programs>v4chat... it apparently only removes the 'program' and leaves the data files - which apparently are 'common' between versions.

Topic: 629 Message: 633

Ian,

I am using a Flex-3000 with Virtual Audio Cable version 4.09. I was
going to suggest making sure line 1 and line 2 were configured correctly
but if you see rcv level then it has to be seeing the receive signals.
Maybe the signal isn't strong enough to turn on the waterfall.

Rick,

Some time back you had mentioned your path simulator software limiting your ability to test below -5dB s/n. I'm not an expert in this area (actually, this is one of MANY areas in which I'm not an expert!), but you may want to see if PathSim from AE4JY can be of any use:
> http://www.moetronix.com/ae4jy/pathsim.htm
Just thought I'd mention it.

Topic: 635 Message: 636

Thanks John
I have used this program in the past and it is fairly limited especially for ARQ testing.

My current setup uses a software controlled (programmed) separate hardware DSP from Oregon Software/Hardware. Once set up (loaded) with path parameters the HF simulator box runs independently of the CPU and can handle two simultaneous channels.

What would really be nice is to start with something like the Pathsim program (nice but pretty outdated...updated in 2000 and no longer updated/supported.) Allow it to run using VAC and multiple instances (so you can pipe multiple channels through it) and run it on a separate computer (from the one you are testing with). This is not a trivial programming effort but something I might look at later next year.

Rick,

Some time back you had mentioned your path simulator software limiting
your ability to test below -5dB s/n. I'm not an expert in this area
(actually, this is one of MANY areas in which I'm not an expert!), but
you may want to see if PathSim from AE4JY can be of any use:
> http://www.moetronix.com/ae4jy/pathsim.htm
Just thought I'd mention it.

From: Rick Muething
Topic: 602 Message: 644

John,
Technically of course they are not needed but they are there now to provide a break if the channel becomes busy. The size of the break (or its elimination) in FEC are likely to change.

Subject: [V4Protocol] Why the pauses in FEC mode?

As I sit here chatting in FEC and listening to the banging of the relay in the SignaLink USB as the transmitter goes in and out of TX, it got me wondering about the reasons behind the breaks in the FEC transmission between each frame. They're certainly needed for ARQ, but do they serve a purpose in V4 FEC?

Just curious.

645. New Features at Sked Page

Yahoo group: V4Protocol
Date: 2010-12-23 15:33:17 UTC
From: Andy obrien
Topic: 645 Message: 645

Thanks to some really amazing work by Joe N8FQ, this group's Sked Page at http://obriensweb.com/sked has had a major upgrade. The intent of the page is simple, a place to go on-line and coordinate QSOs and digital mode experiments. The upgrade includes more efficient database methods, ability to list your QRG next to your callsign. Display of DXCC unities on line in addition to the usual display of states and callsigns. A more convenient method of logging out is added , plus a very useful private mail function (click on a call sign) For digital mode skeds, the digitalradio" tab is the one you want. FYI, the LoTW tab also has quite a few users that are using digital modes for their LoTW awards, so that is worth a visit too (but users there expect you to be LoTW active)

Andy K3UK

646. SMS Alerts now possible at K3UK

Yahoo group: V4Protocol
Date: 2010-12-23 15:41:40 UTC
From: Andy obrien
Topic: 646 Message: 646

One more new feature at the K3UK Sked Page. We have now implemented a SMS Alert feature, you can receive a text message to your mobile phone whenever a needed USA State, DXCC entity , or USA County logs on to the sked page. You can specify which sked page your want the alert to be associated with (SKCC, LoTW, QRP, FISTS, Digitalradio, etc). To set-up your alerts, just click on EDIT at the bottom of your screen and then ALERTS. The Sked Page is at http://www.obriensweb.com/sked .

Evening all,

I don't know if my comments are of any help or not. However, I just upgraded from v 0.1.3.0 to 0.1.6.0.

I first had to remove the previous version before I could install the new verion.

I am using Windows XP and I have a folder on my c: drive called usr i.e. c:\usr where install any software that is ham radio or electronics design in nature; it is just a separate place to help keep these things in order.

When installing, the installation program asks where I want to install the application and it suggest c:\v4chat which I change to c:\usr\v4chat.

Would not be possible for you do something similar like replacing the the c:\v4chat suggested with f:\v4chat or similar?

I have only just started to mess about with this app. I have not yet made a contact nor have I successfully been able to monitor any activity. I know it is there, I just haven't got everything lined up yet.

cheers, Graham ve3gtc

653. New Release 0.1.7.0 Posted on Yahoo V4Protocol site.

Yahoo group: V4Protocol
Date: 2010-12-23 22:09:09 UTC
From: Rick Muething
Topic: 653 Message: 653

All,

Been battling a bad cold but this update should improve performance and takes care of some minor issues. See summary of revision files below. Please let me know of any serious problems.
73,

Rick KN6KB

V4 TNC Revision History
12/23/2010 0.1.7.0 Fixed inadvertent changes in Squelch from "mouse wheel"
Modify receive level reporting to eliminate averaging...showing true peaks.
Modify "distance" calculation and plotting to constellation. New I,Q limits 0<(I,Q)<256
Change "distance thresholds" in Process symbol ACK/NAK = 50, FEC/ARQ = 200
Modify V4Demod.ComputeIQHistoryRSSDistance to add distance bias of 100
Modify/correct Correlation calc in SearchForAMLeader47B to use avg N of 3 bins in calc S/N

V4 Chat Revision History
12/23/2010 0.1.7.0 Change Mini log edit to allow date/time edit and error checking.
Update documentation and Help

From: Rick Muething
Topic: 656 Message: 657

Edgar,

V4 and V4 chat does not need internet access. The only TCP IP connection required is one local to the machine (same computer) from V4Chat to the V4TNC on the ports specified (defaults 8510, 8511). This is NOT and internet connection but does require that the computer have the TCP Protocol installed (almost all do now days). You will also need .NET 3.5 installed and the installer should check this and indicate if it is missing from the target machine. If you have installation problems you'll have to be more specific about the errors or issues than "but didn`t succeed on my stand alone PC".

73 and Merry Christmas,

Rick KN6KB .

659. Decoding problems

Yahoo group: V4Protocol
Date: 2010-12-24 15:02:25 UTC
From: Graham
Topic: 653 Message: 659

At the moment (2010-12-24 14:57 UTC) I am monitoring 14073 and hear a couple of signals, some very weak but a couple that are fairly strong but I do not get a very good decode on any of them NC5O is one and KN6KB is another - just enough decode to figure the calls but that is about it.

I have played around RX audio levels but it hasn't made any difference. Is V4 that sensitive to receive audio levels? I have no problem with PSK,JT65, WSPR etc - just V4.

Suggestions?

cheers, Graham ve3gtc

From: Rick Muething
Topic: 653 Message: 661

Graham,

The receive audio level should be in the green area of the level bar. If it goes RED it can overload the sound card and decrease the decoding. In the blue you don't have enough audio and decoding will be marginal. There is no "sweet spot" for audio level...it works on the RATIO of signal to noise in a FFT.

You also of course have to be correctly tuned within the auto tuning range. If the V4 Signal (the entire signal...200 Hz wide) fits INSIDE the green tuning lines the auto tune capability of the V4TNC should tune it in (to about 1 Hz accuracy). The offset of the remote station is shown on the TNC form. You can set the capture (tuning) range in the setup....default = +/- 100 Hz. Trying to "zero" the offset with the dial isn't necessary and won't improve decoding.

If you are still having problems do this. Make sure all your levels and tuning is set correctly as above. Turn on V4 debugging (Setup). Try and listen to a remote station noting the time (UTC) of the test. Then send me your V4 TNC Debug <date>.log and the time (UTC) of the test and what you observed. That debug log tells me much more than you could describe in an email! Send the log (as an attachment) directly to rmuethingATcfl.rr.com

To get to the non-existent "C:" drive, you can use the DOS command SUBST. Open a command window and type "subst /?" to get the syntax. Once you get it to work the way you want, just create a ".bat" batch file and execute it from a shortcut placed in the "startup" folder.

Hello to the whole group.

I am finding hard time installing the V4Chat 0.1.7.0 for my FLEX-3000.
I use virtual serial port made by ETHERLOGIG, VSPE, that I find since then at
http://www.eterlogic.com/Products.VSPE.html
It's the free edition that I installed under W7.

The V4 setup doesn't find those serial ports i created with that package. I didn't tried others serial ports emulators as I use it with success since one years ago. It see the physical COM1 and some other COMs, 5 to 8, that are made by Eltima virtual serial port driver.

Does anybody other using V4Chat with FLEX?

If the answer is yes, would you please tell me witch is yours serial port emulator.

I will try also with those Eltima Serial ports made by the MicroHam packages that I own. But to date with the MK2 and a IC-7700, using the V 0.1.3.0 version of VChat I have had no joy. The PTT seem to hang on after the any TX attempt. I will ASAP check agn with 0.1.7.0. By the way flushing manually the TRANSMIT button stop the stuck TXing disease of my poor RTX.

Finally, just to know, the whole setup is pretty well working without a glitch with N1MM, DM780, WSPR, WSJT and MIXW ... so I suppose that the whole bunch of bit and pieces inside and around my setup is still working. I mean that I have not problems speaking about other HAM software packages.

I really would give a try with V4Chat, any FLEXer out there ...

Salvo,

Several Flex owners are using VSPmgr (free) and it may be obtained here:
http://k5fr.com/ddutilwiki/index.php?title=VSP_Manager

In "Radio settings" use PTT Port (optional) and RTS for control (both V4 and Flex).

Hi Salvo,

With my Flex3000 I use com0com. I tried N8VBvcom and I had trouble getting it to work with my Windows 7 64 bit system. With com0com I had to turn enable test signing and run the install and setup with admin rights. The help section explains it. The defaults start with CNCA0 and CNCB0. I changed the ports to COM7 and COM17 for one pair and COM6 and COM16 for the other pair. In the PowerSDR for CAT Control I used COM16 and for PTT I used COM17. In V4Chat I set the Radio Control to use COM6 and the PTT Port to use COM7. Both are set to 57600 baud, RTS and DTR. Very easy to set up. Along with the Virtual Audio Cable it's a virtual world of no cables :-)

Hello Howard,

I hung out there for a while and snagged a Hellschreiber QSO which was fun for a change but V4 Chat did not decode anything. For now, I have abandoned the radio room to watch Green Bay and the Giants. I might try again later tonight but thanks for giving me a shout. We will manage to make something happen eventually.

Happy New Year, Rick. I'm sure I speak for all of us when I convey my thanks for another year of your hard work programming for the benefit the digital community of Amateur Radio.

I've been and am a strong supporter, but at the risk of irritating those who have been excitedly waiting for the release of ARQ functionality, I going to be bold enough to ask tha instead of diverting focus at this point toward another set of issues, might it be worth a bit more time to tweak FEC mode's performance a bit more in weak signal and poor band conditions?

I've been monitoring (and working) more often lately, and even with version 0170 I just can't rid myself of the impression that in poor band conditions I could be easily making good QSOs with any of a few other modes, when with V4FEC I get little more than sporadic decodes. With several of the other soundcard modes when I can just barely hear that there's a signal on frequency I know I can get usable (often 100%) text, but in those same conditions I struggle with V4FEC to get frames decoded.

Have we reach the point of diminishing returns with effort on the performance of V4FEC?

But then again, perhaps I should just quietly wait and see.

73 and thanks again,
John W2KI

Topic: 683 Message: 687

John,

There are several issues here.... For one thing it is literally impossible to tweak, tune or even accurately evaluate the performance of ANY digital mode without a controlled environment such as those on a HF simulator of some type. e.g. Many casually associate the “quality” of the signal with its strength....one factor but path distortions (multipath, doppler etc) are actually more critical than just signal strength. For example I have run both PSK (31, 63 etc), WINMOR and V4 through various channels and PSK modes (including those PSK modes in WINMOR) do not fare well in poor multipath environments such as NVIS, aurora etc. Though most narrow band slow modes (e.g. PSK31) can be made to perform well in weak signal (white Gaussian noise) environments.

Optimizing a protocol for general usage environment entails repeated optimizations for factors such as error correction coding, automatic tuning, ARQ reliability (protocol robustness), poor multipath propagation as well as weak signal. For example it is possible to get another 1.7 dB or so weak signal performance by doubling the sound card sample rate and FFT sizes (at the expense of CPU loading) and I will look into that at some time in the future. But I want to get the basic protocol functionally working which includes ARQ before launching off into some of these optimization efforts. One thing ARQ will allow is to lower the detection thresholds (those magic constants inside the program no one sees!) that determine for example if and when a frame sync is detected. For true ARQ the thresholds can be set more aggressively since the ARQ protocol protects against any bad data getting through. This for example will allow better weak signal net throughput yet still allow the 100 % copy that ARQ allows.

To put it in perspective...The WINMOR protocol (more complex for sure than V4) took over 2 years to develop and optimize. Pactor 3 (with the PTC II’s massive DSP power) was optimized for over 10 years. These things all take time, real engineering effort and controlled methodical testing. Surely over the air rag chews are fun and provide good feedback on functionality and desired functions but when it comes to really MEASURING performance (error rates vs. S/N over standardized CCIR channels) there is no substitute for using the HF channel simulator and performing hours of testing and statistic collections.

The theory and initial tests I have run with V4 suggest it can be made very robust and still fit in a narrow 200 Hz channel and deliver modest 50+wpm typing speeds. It will however always be possible to design and field modes that offer better weak signal performances by using slower throughput (e.g. PSK31, JT65 etc) and/or wide bandwidth (e.g. Domino/Olivia).

691. V4 Rate Worksheet

Yahoo group: V4Protocol
Date: 2011-01-03 18:35:20 UTC
From: ai1v
Topic: 691 Message: 691

Hi.

I've been reading the V4 spec and noticed an issue with the V4 rate worksheet. For the ARQ modes, it appears you only included 1 T/R switch time in the Frame Cycle computation. Shouldn't there be two? That makes the net throughput numbers:

ASCII ARQ: 30.62/262.49/43.75
UTF-8 ARQ: 32.01/240.08/40.01
(bps, chr/min, wpm)

Also, in the ARQ Frame Timing Details diagram, Tdly is between 50 and 100 ms. If we assume that the decoder flush time (128 ms) overlaps with the T/R time, we still end up with a max of 228 ms between T and R according to the diagram. Also, since there is no flush at the end of the ARQ packet, that is even more of a discrepancy.

Sorry if these issues have already been addressed.

Rick,

If I'm reading the slides correctly, then in future presentations you might want to replace "slickness" with "low latency".

Gary,

I somehow had missed this. I Uploaded the DCC 2010 presentation but there are some technical changes that are now in the protocol that aren't reflected. When I release the ARQ version I'll go back and update the help and some of the documentation.

Gary,

Yes probably so...slickness is probably some bad slang for Low latency!

Rick,

If I'm reading the slides correctly, then in future presentations you might want to replace "slickness" with "low latency".

Read the help and trouble shooting sections. You enter data into the keyboard text box. A Ctrl<Cr> (Return while holding down Ctrl) will cause the data in the keyboard window to be transferred to the outbound buffer and send in FEC mode. ARQ is not yet enabled.

713. Receiving V4

Yahoo group: V4Protocol
Date: 2011-01-07 12:32:09 UTC
From: slotman2000
Topic: 713 Message: 713

Hello all. I wonder if any one else has the same problem when receiving V4. The "Channel busy" is showing a lot of the time even when receiving a reasonable V4 signal. in this state the TNC ignors the V4 signal. When it does reconize the V4 then it shows busy V4 which is correct.I have the audio level set so that receiver noise is in the blue and with a signal it is just in the green. 73 Don G3VCG

714. Re: [V4Protocol] Receiving V4

Yahoo group: V4Protocol

From: Rick Muething
Topic: 713 Message: 714

Don,

The best level for the audio is to be mid range or well into the green.
You can adjust the sensitivity of the busy detector using the squelch control as described in the help. 10 is least sensitive.

Topic: 713 Message: 715

Don,

I've often experienced the same situation. What sounds like a reasonable V4 signal but nothing at all decoded and Channel Busy indicating. Then, after the missed frame (or two), the next V4 frame will be decoded with quite a high score. Yet at some other times I've seen successful decoding with scores far lower (even after Rick recently changed the scoring).

I run my receive level about 2/3 to 3/4 up into the green. I've tried adjusting the Busy/Squelch threshold, but haven't been able to see a difference with these missing frames being decoded.

Admittedly, this is not in any way rigorous testing. Running 0170, of course.

717. Re: [V4Protocol] Character set. UTF-8 Spinnoff to RMS Express?

Yahoo group: V4Protocol
Date: 2011-01-07 16:49:54 UTC
From: Rick Muething
Topic: 700 Message: 717

Finn,

RMS Express/WINMOR transmits compressed pure binary data (8 bit bytes). The encoding of that could be anything. It is also possible to attach a binary attachment that employs any desired encoding. It is possible to add support for multiple character sets to RMS Express but it is a significant effort. The easiest solution would probably be to use Paclink which supports a 3rd party mail client. Then any character set supported by that mail client could probably be used.

In software it is not normally a question of “can it be done?” but usually “Do we have the skills, resources and time to do the work and does it benefit the general population?” For an all volunteer and very small programming staff providing free software and supporting it the answer to the later question is often NO. A large part of the ham community still do not value software even when modern software now does many of the functions of conventional hardware (e.g. TNCs etc). Just because the software can be copied on a 10 cent CD does not mean it is free to design, debug, deploy, document and support.

I have specifically designed V4 as a text only mode which eventually will be able to support UTF-8 character sets. The idea being able to support more complex and multi language character sets. While the hooks are there and in the spec there is still a lot of programming and documentation necessary to make it available to users. That translates to skills needed and hard work work expended. I would very much like to get some help on this but that has to come from someone with .NET programming skills and a thorough understanding of how the UTF-8 character sets work and are applied.

Rick. Copied, and even maybe partly understood. Just a wish, as just informed that in whole EU some recommendations seems heading to UTF-8.

I see your "problem", time, even unpaid!, and lack of skill in the "user" community to give usable assistance.

And off course then the rest of the world....with other character sets.

I just got the idea since you yourself did mention UTF-8 as a maybe future part of V4. And I at the same time checked the RMS Express garbled readout when forwarding e-mails to my self from G-mail enabling sending using UTF-8 instead of their socalled "Normal Character set" into my winlink account doing download using RMS Express WINMOR.

Thinking "spinnof", similarties, modules, or whatever from V4 into RMS Express in due time.

It is ok the reverse direction, from Winlink to G-mail.

Winmor not supported by Paclink as pr now? And no P2P and same level of simplicity.

Luckily G-mail at the time beeing do default to "Normal", but for how long?

It is possible to add support for multiple character sets to RMS Express but it is a significant effort. The easiest solution would probably be to use Paclink which supports a 3rd party mail client. Then any character set supported by that mail client could probably be used.

A large part of the ham community still do not value software even when modern software now does many of the functions of conventional hardware (e.g. TNCs etc). Just because the software can be copied on a 10 cent CD does not mean it is free to design, debug, deploy, document and support.
>
> I have specifically designed V4 as a text only mode which eventually will be able to support UTF-8 character sets. The idea being able to support more complex and multi language character sets. While the hooks are there and in the spec there is still a lot of programming and documentation necessary to make it available to users. That translates to skills needed and hard work work expended. I would very much like to get some help on this but that has to come from someone with .NET programming skills and a thorough understanding of how the UTF-8 character sets work and are applied.

Yusssi,

There is no advantage in audio filtering prior to the V4 demodulator. The V4 demodulator DSP does specific filtering down to the narrow 200 Hz bandwidth of the V4 mode. It uses frequency bins of approx 46Hz wide to detect the 4 FSK tones.

The only advantage of pre filtering is if it is done BEFORE the receiver AGC is to eliminate AGC capture by a stronger adjacent signal. Post AGC audio filtering has no benefit in most cases.

It would be possible to allow some adjustment of the V4 center frequency (currently 1523 Hz) but this has a large impact to the code and more important will cause a lot of confusion since every connection must then be computed and described to RF center frequency instead of USB dial frequency. E.g. If you and I would have different V4 center audio frequencies we would have to know what those audio center frequencies are before we could set the radio dial so we could initiate a connect (FEC or ARQ) on the same RF frequency. The built in automatic tuning capability of V4 (user selectable 20 to 200 Hz) is only to accommodate radio calibration errors and drift.

Standardization on audio frequencies has been proven (in Pactor 1, 2, 3 and WINMOR) to be a benefit and substantially reduces the confusion of Radio Dial and RF Center frequencies.

GA Rick,

Your comments on 'varible audio frequency' digital modes are interesting considering that most keyboard to keyboard digital modes can be used with varible audio frequencies and are not on fixed ones like Winmor or V4. Typically the only modes that are "fixed" involve a wide audio bandwidth and therefore are fixed at one audio center frequency to insure that the total signal will pass through the TX sideband filters unattenuated. The rest are tunable. Even wide modes like Olivia at 500 Hz and 1KHz. wide are tunable. Some implementations of MT-63 are fixed and some are not depending on the program. If one chooses to use MT-63 at the 2 KHz width it is pretty much stuck at a fixed frequency just to get it inside the sideband filters. Many KB to KB operators just set there radio dial to one common frequency and just 'tune' by selecting the audio frequency to be decoded and encoded. This also facillates the use of 'browsers' for modes like psk, rtty or cw where the program (browser)locks on and decodes multiple signals at the same time and displays them. If the decoders and encoders were all stuck to a single audio frequency then browsers would not be possible.

The other issue is being able to make use of the rigs narrower filters or sweet spots to help with heavy adjacent channel QRM. In my case, I have several filter combinations available in my rig but none of them are or can be centered around 1500 Hz. The "CW" filter can be centered anywhere between 400 Hz and 1000 Hz and can be made anywhere from 50 Hz to 1 KHz wide. The "FSK" filter has two centers, one around 1275 Hz and the other 2275 Hz(I think) and can be either 500 Hz or 1KHz wide. The "SSB" filtering bottom (hpf function) stops at a high of 1000 Hz and the top (lpf function) stops at 1400 Hz. The lpf can be set at 1.6KHz or 1.8 Khz which will clean up the QRM above us but as close as I can get to the bottom end with the hpf is 1000 Hz. I don't know of any rigs where their narrow filtering is centered around 1500 Hz. but there may be.

I understand why Winmor is centered on 1500 Hz. but V4's bandwidth doesn't dictate that it has to be centered around 1500 Hz. It is narrower than many of the other kb to kb modes.

FWIW.

722. V4 Causing Switch to Tx Mode

Yahoo group: V4Protocol
Date: 2011-01-09 04:55:20 UTC
From: jazzfanrq
Topic: 722 Message: 722

Greetings: I am a "newcomer" to the V4 application. Tonight (1/7) I joined the "V4 Group" here on Yahoo and downloaded Version 1.7.0 of this application. However, during Setup I've selected Com Port 1 (.the only one shown) and it immediately places my rig (i.e, ICOM 745) into the Tx Mode and won't release this mode until I shut down the application. Has anyone experienced this problem? Your assistance is very much appreciated.

Rick's comments about standardized center frequencies, USB dial offsets, etc., make perfect sense if you're talking about connecting to a fixed, always there, station on a specific published frequency, as is the case with Winlink stations and so on. You have to know exactly where the automated station is listening or you simply have no chance of connecting.

But keyboard to keyboard digital modes have been very successful without this limitation. Typically you have one station who calls CQ and is "found" by others listening and looking at their waterfall display. Most successful programs today have the flexibility to simply click on the signal you're hearing (seeing) and automatically adjust their transmit audio frequency(s) to suit. Allowing you to specify your own tones to be within your "pre-filters", however narrow, is another advantage, in my opinion.

If you want to pre-arrange a QSO, we've all learned since the start of sound card modes years ago, to state the meeting place in terms of dial frequency and offset, for example 14,073 USB (1000 Hz tone). In any case, if you're a bit off, it's a lot easier to simply click on nearby signals to see which is the one you want, rather than having fixed tones and tuning the radio dial, which is much slower (proven by me in many years of RTTY contests). Most modern client programs also allow you to see the previous "n" seconds of signal, too, by re-decoding an audio buffer, so clicking on one or two candidates to find the one you want (if necessary) is not an obstacle.

So here's another vote for flexible transmit frequencies.

One point more:
With JUMA I can calculate memorry channel frequency offset e.g. for 800 Hz
center QRG, and so I'm just for example on 14.073 for other stations using
standart center frequence.
I use this method by Multipsk program and working ufb!

From: Rick Muething
Topic: 719 Message: 727

Dave,

As I said on my original post. It is POSSIBLE to make the range variable. I have not evaluated that code but since I am using Goertzell filters instead of FFTs for tone detection it should work. (Goertzell tone detectors can be put exactly on any frequency not requiring the frequency “binning” in the FFT). In some cases (your example of the narrow CW filter) this may improve reception by filtering out nearby adjacent stronger signals before they could capture the AGC. If the nearby signal is NOT stronger the CW prefilter will have no affect. The filter in the V4 detector is only approx 200 Hz wide.

But I still stand by my experience over many years with the variable tones available in Pactor and the continual confusion it promotes with Dial vs Center RF frequency. Making the tones variable (in any mode) and or sideband reversal insures this level of confusion though it can usually be understood once explained.

But the more important issue is one of FOCUS. Please remember this protocol is about a month into ALPHS testing and I have several things I am also working on. Tasks like improving sensitivity, leader detection and tuning and getting the ARQ mode to work are FAR more important than adding another entry to the setup and updating all the code to allow variable tones. This of course all has to be documented, explained, etc and none of that will improve the sensitivity or ARQ functionality.

Good software like fine wine takes time and attention to detail. More software dies of indigestion than starvation. I want to focus on the things that are most important and leave functional “frills” (display and GUI tweaks, variable tones, reversible sidebands etc) to later after we have a solid and proven base from which to build.

The "CW" filter can be centered anywhere between 400 Hz and 1000 Hz and can be made anywhere from 50 Hz to 1 KHz wide. The "FSK" filter has two centers, one around 1275 Hz and the other 2275 Hz(I think) and can be either 500 Hz or 1KHz wide. The "SSB" filtering bottom (hpf function) stops at a high of 1000 Hz and the top (lpf function) stops at 1400 Hz. The lpf can be set at 1.6KHz or 1.8 Khz which will clean up the QRM above us but as close as I can get to the bottom end with the hpf is 1000 Hz. I don't know of any rigs where their narrow filtering is centered around 1500 Hz. but there may be.

I understand why Winmor is centered on 1500 Hz. but V4's bandwidth doesn't dictate that it has to be centered around 1500 Hz. It is narrower than many of the other kb to kb modes.

FWIW.

Dave K3GAU

>>> "Rick Muething" 01/08/11 8:03 AM >>>

Yusssi,

There is no advantage in audio filtering prior to the V4 demodulator. The V4 demodulator DSP does specific filtering down to the narrow 200 Hz bandwidth of the V4 mode. It uses frequency bins of approx 46Hz wide to detect the 4 FSK tones.

The only advantage of pre filtering is if it is done BEFORE the receiver AGC is to eliminate AGC capture by a stronger adjacent signal. Post AGC audio filtering has no benefit in most cases.

It would be possible to allow some adjustment of the V4 center frequency (currently 1523 Hz) but this has a large impact to the code and more important will cause a lot of confusion since every connection must then be computed and described to RF center frequency instead of USB dial frequency. E.g. If you and I would have different V4 center audio frequencies we would have to know what those audio center frequencies are before we could set the radio dial so we could initiate a connect (FEC or ARQ) on the same RF frequency. The built in automatic tuning capability of V4 (user selectable 20 to 200 Hz) is only to accommodate radio calibration errors and drift.

Standardization on audio frequencies has been proven (in Pactor 1, 2, 3 and WINMOR) to be a benefit and substantially reduces the confusion of Radio Dial and RF Center frequencies.

GE Rick,

Your original comments seemed to say fixed frequency was better than varible frequency. I was mearly pointing out that many other digital modes quite successfully use varible audio frequencies and that one of the drawbacks of a fixed frequency is that in many cases it doesn't allow an operator the chance or option to use what resources he has available in his rig to help dig the desired signal out of what happens to be around it. I listed what resources I had available in my rig to point out that, even though I had all those various filter combinations available, none of them coinsides very well with a signal that happens to be centered on or near 1500 Hz.

I do agree with one of the other comments that said that for modes like Winlink and Winmor where the most likely contacted stations (RMSs) are 'fixed' frequency, fixed audio frequencies make sense but for kp to kp modes no so much.

Whether or not you decide to make V4 varible frequency and when you choose to do it is up to you. I am just letting you know that, if you are interested in what the potential users would like for V4, chaulk up one vote for varible frequency. That is all. :-)

Dave K3GAU

>>> "Rick Muething" 01/10/11 6:24 PM >>>
Dave,

As I said on my original post. It is POSSIBLE to make the range variable. I have not evaluated that code but since I am using Goertzell filters instead of FFTs for tone detection it should work. (Goertzell tone detectors can be put exactly on any frequency not requiring the frequency “binning” in the FFT). In some cases (your example of the narrow CW filter) this may improve reception by filtering out nearby adjacent stronger signals before they could capture the AGC. If the nearby signal is NOT stronger the CW prefilter will have no affect. The filter in the V4 detector is only approx 200 Hz wide.

But I still stand by my experience over many years with the variable tones available in Pactor and the continual confusion it promotes with Dial vs Center RF frequency. Making the tones variable (in any mode) and or sideband reversal insures this level of confusion though it can usually be understood once explained.

But the more important issue is one of FOCUS. Please remember this protocol is about a month into ALPHS testing and I have several things I am also working on. Tasks like improving sensitivity, leader detection

and tuning and getting the ARQ mode to work are FAR more important than adding another entry to the setup and updating all the code to allow variable tones. This of course all has to be documented, explained, etc and none of that will improve the sensitivity or ARQ functionality.

Good software like fine wine takes time and attention to detail. More software dies of indigestion than starvation. I want to focus on the things that are most important and leave functional “frills” (display and GUI tweaks, variable tones, reversible sidebands etc) to later after we have a solid and proven base from which to build.

Subject: Re: [V4Protocol] Adjustable or alternative center freq for CUBE and JUMA?

GA Rick,

Your comments on 'varible audio frequency' digital modes are interesting considering that most keyboard to keyboard digital modes can be used with varible audio frequencies and are not on fixed ones like Winmor or V4. Typically the only modes that are "fixed" involve a wide audio bandwidth and therefore are fixed at one audio center frequency to insure that the total signal will pass through the TX sideband filters unattenuated. The rest are tunable. Even wide modes like Olivia at 500 Hz and 1KHz. wide are tunable. Some implementations of MT-63 are fixed and some are not depending on the program. If one chooses to use MT-63 at the 2 KHz width it is pretty much stuck at a fixed frequency just to get it inside the sideband filters. Many KB to KB operators just set there radio dial to one the audio frequency to be decoded and encoded. This also facillates the
use of 'browsers' for modes like psk, rtty or cw where the program (browser)locks on and decodes multiple signals at the same time and displays them. If the decoders and encoders were all stuck to a single audio frequency then browsers would not be possible.

The other issue is being able to make use of the rigs narrower filters or sweet spots to help with heavy adjacent channel QRM. In my case, I have several filter combinations available in my rig but none of them are or can be centered around 1500 Hz. The "CW" filter can be centered anywhere between 400 Hz and 1000 Hz and can be made anywhere from 50 Hz to 1 KHz wide. The "FSK" filter has two centers, one around 1275 Hz and the other 2275 Hz(I think) and can be either 500 Hz or 1KHz wide. The "SSB" filtering bottom (hpf function) stops at a high of 1000 Hz and the top (lpf function) stops at 1400 Hz. I second David, but also partly Rick, in the way: Do the protocol important issues FIRST, but THEN in the END this choice of tones is VERY IMPORTANT for getting the most out of MANY OLDER RIGS!

Why is it called SOFT WARE, compared to HARD WARE. Yes because it can be "twisted" the way the programmer want to do.
And if the programmer want to SELL IT TO THE CUSTOMERS, it is the customers (or clients who are the judges).

But Rick is right, what if the price is 0 ? Then the programmer has to be out of his mind doing something else than what is FUN PROTOCOL development. And I don't think he is quit out of his mind.

This isn't easy, and also because I know of an uncounted number of times trying to explain for fellow hams, how to tune and or invert an old AMTOR or RTTY signal, ON BEFOREHAND for a SCEDULE.

This suddenly became easy with Pactor 3 and Winmor. No discussion.
Period.

Good Luck.

I would also count for variable (setable by user) frequency
Should be possible for the user to store that setting and it should be (re)set after startup ...
You can then store the qrg like you prefer it ... say you work with channel centered to 2000hz ... now you can use the passband tuning or if shift or whatever you have in your rig to use just the upper part of the audio passband ....(maybe use rtty filter for receive and use split for transmitting in ssb)
Or you can set qrg (dial setting) that your audio (digital) channel is centered around 1000 and set pass band or if shift to lower side and use only the low tones
I would prefer the high tones as harmonics would fall out of the passband (lower risk of "fence" like signal)
Just my 2 cents (and one vote for adjustable by user)

Hello Group,

I've been lurking in the shadows for a while now as the reissues of the V4 have been updated. I waited for this to calm down before I installed V4 on my computer.

That done, I got it working and it tranmits ok, Now for some qso's.

I monitored 073 on 40 meters this morining but didn't see any signals so I called a couple of times but got no replies.

Changing bands for me is quite a chore because it requries changeing the configuration of the Buddipole on the porch of my condo. This takes a while to do so I can't just hit a switch to change bands.

I'm on 40 until I change it to some other band.

Can y'all help me get a qso going here?

Where d'y'all hand out?

Rick,

I agree 100% with your focus at this point of getting the V4 TNC to work as well as it possibly can, and the same with the ARQ protocol. I well understand that "feature bloat" has doomed many good intentions. My comment on frequency agility was made only in comparison with ease of operating with other current keyboard to keyboard modes and existing software, and to simply register a vote.

At this early stage, since there is no other developers are yet incorporating V4 into their user interface "wrappers" (of course it's too early to do so), we are all very happy to enjoy the fruits of your labor on the modem and protocol layers. When V4 eventually gets incorporated into the current well knows user programs we will all benefit.

Also, if we keep taking up your time with notes such as these, it will mean less time for you to work on the REAL task.

Thanks for all your major effort.

Hello Rolan and the group,

Making the first contact using a new mode can be like pulling teeth but this one went pretty smooth, Tnx Rolan

I'll be lurking on .073 eagerly awaiting better band condx.

I called a few more times later on this morning, and didn't get any bites. I'll leave the radio on this frequency and look for activity tonight.

A fully featured interface would be nice but this will do for starters. I'd like to see F key controled macros for easy sending and infor exchange. Maybe later?

Now that I have the V4 software installed and working, I'll pay more attention to this group and look for you all to post times and frequencies for your activity.

more information from version 0.1.7.0: the end-of-audio to end-of-TX delay is now consistent with full-duplex _disabled_.

the delay duration is on the order of half a second, instead of varying from half a second to a little over a second.

> >
> > Re the embedded Ctrl<Cr> : A good point. I will look at this and see what can be done. Since the user files are generated by a standard utility (e.g. notepad, word pad, word etc) it has to be made using a character that can be keyboard entered (basically a printing character) or string of printing char e.g. something like â□□~â□□ or â□□###â□□. When the file text is then loaded into the keyboard text box the special char or string would be replaced by Ctrl<Cr> and trigger the send to the output buffer. Iâ□□m inclined to use a string like â□□###â□□ not likely to ever occur in normal text. Any comments out there on this?

From: kb3cs
Topic: 744 Message: 744

I note when I send a long string of "kkkkkk" chars, I can (by ear!) hear the V4 modem sending the same symbol using the same tones over and over.

This leads me to a question: given the usual RF channel characteristics on HF, is this an "ok" thing to do?

I know DominoEX rotates the carrier map so different tones are used for each succeeding symbol.

I'm having the same problem. In my case the system is on the I: drive.
The C: drive is another non-windows partition
on the same drive so I can't use the subst command to remap. Is there
anyway to get the setup program to accept a
different drive?

thanks,

From: Raymond Lanza
Topic: 648 Message: 747

Okay I solved my problem. The original windows installation was done to a second partition which wound up being drive I:. Drive C: was a USB port, I'm not sure why but it was. I renamed to the USB port to J: and then I was able to add a virtual C: drive using the subst command.

subst C: I:\

That satisfied the setup program. Once the setup program was up and running it did provide the option to install on a different drive. I installed on I: which is my system drive.

Topic: 744 Message: 748

Chris,

Domino rotates the tones because it does not use a fixed length frame and without a fixed length frame it could loose (or never acquire) symbol sync on repeated characters. V4 uses 4FSK (less bandwidth) and fixed frame and symbol timing and a unique frame and symbol sync which identifies the frame type. There is code in V4 that still tracks symbol framing over the expected errors in sound cards (up to about 4000 ppm...which is a pretty large error). V4 also uses Viterbi encoding with soft decoding to send 1 bit of FEC for each bit of information. The Viterbi encoder spreads each symbol out over 7 symbol times (K=7, Rate = 1/2 or the NASA Voyager encoder) which is good for both VHF and HF propagation. While it is possible to make V4 more robust (more FEC) the current goal is to make it as robust as possible and still fit in a 200 Hz bandwidth while allowing typing speeds of about 50 WPM. The V4 ARQ Mode which I am now testing will provide error free operation even in poor channels through repeats which of course will reduce the throughput on poor channels but insure error free delivery of text unless the channel is so poor the ARQ would timeout.

755. V4 CHAT, ALPHA Testing, and Ham Use

Yahoo group: V4Protocol
Date: 2011-01-17 03:44:19 UTC
From: W6IDS
Topic: 755 Message: 755

This forum has become fairly quiet for an Alpha Testing activity.

Does this mean that we've found all the peculiarities that need attention?

During the ACTIVE testing, as such, has anyone given any thought at all as to usefulness of the protocol for daily comms as compared to the likes of RTTY, PSK flavors, BPSK flavors, etc?

Has anyone given any thought as to promoting the protocol for testing above and beyond the small group of ALPHA testers we now have?

If there's interest in using the protocol for real, any ideas as to how to handle it? Is it supposed to be isolated within the confines of a specific space or allowed to be used in the same manner as RTTY, OLIVIA, etc?

I know, I know.... I'm just asking, knowing full well we're still waiting for ARQ to be released. That said, who's best to make the decision as to how it should be used - experienced PacTOR operators or any of us? Is it to be channelized or allowed to be controlled by the VFO like RTTY, OLIVIA, PacTOR I and II, etc?

I ask because I'm sure that WL2K won't want it per se, other than ARQ messaging as afforded by RMS Express, etc. OOPS, wait a minute. This won't be the same animal I think, so WL2K application doesn't fit here <GRIN>.

So, any thoughts on this? Anyone? Anyone?

Most of the testing activity seems to be straight V4 Chats. It's hard to gauge performance without A:B comparison. Perhaps it would be worthwhile to test V4 "side-by-side" under actual operating conditions with modes such as PSK125/PSK125R, DominoEX4, MFSK8/16, Olivia4/250, etc. Thoughts?

Hi Howard

Yes, this forum has gone quiet. This could mean that either everything seems to work fine, and we are waiting for the ARQ version, or that people have given up on it.

I personally have given up on it, for two reasons:

1. V4 seems to need a very strong signal before it will decode. I have found that signals need to be approaching S7-8 before it works, whereas PSK250 signals, for example, decode every time at very little above the noise level. Time and again I have heard very strong V4 signals in the speaker, but they just don't decode.

2. The V4 system seems to be far too sensitive to Busy conditions. Time and again I find it won't transmit because there is a weak PSK signal or other data signal nearby (but >100Hz away from V4 center), when there is no obvious reason why V4 transmission should be held back.

I hope Rick can address these issues. Otherwise there are far better chat/messaging systems around that are already well established (pskmail, for example).

Howard,All

Just a few things for clarification. The V4 ARQ is coming along. I have it basically working through the simulator but it is probably at least a week before any release for alpha testing. Main problem is there are only 24 hours in the day and I have a lot of other personal and programming commitments right now.

Once I get V4 ARQ working I'll look at making the default tone user selectable. There are some pros (flexibility with filters) and cons (confusion with Dial frequencies) with this but it is worth evaluating.

The V4 protocol like all modes has to have compromises. The goals and constraints I put on V4 were: 200 Hz bandwidth (to fit into current or future bandplan by bandwidth restrictions) and 50 WPM typing speed (typical max manual speed). I would like some feedback on these and how they compare with other modes. For example it is very easy to add an outer layer of RS FEC to give improved robustness at the cost of typing speed. (e.g. we could get 2 character corrections/frame by dropping to about 38-40 WPM net speed). Or additional robustness could be achieved by expanding the number of tones (bandwidth). These changes probably shouldn't be considered until we have evaluated the ARQ mode.

As far as WL2K is concerned it is not at all likely V4 would ever be used. It would offer no advantage (other than say narrow bandwidth) over WINMOR and is considerably slower. I conceived V4 in response to many requests (during the testing of WINMOR) to provide a chat mode for peer to peer QSOs. It was relatively easy to pick selected pieces of code from the WINMOR TNC to implement V4 making its development much simpler than starting from scratch.

All I ask is if someone is doing A/B comparison tests with other modes they do every thing possible to document the test and to try and insure the tests are done over equivalent propagation conditions (either simulator or averaging results across tests run over nearly the same conditions). Also I would be interested in feedback as to where the desired tradeoffs are.

Topic: 755 Message: 759

My two cents, offered in the spirit of honesty and not meant to be harsh or critical...

So far the mode is very uninteresting for many of the same reasons others have mentioned: mediocre performance and a solution looking for a problem.

A significant issue is that the software itself does not have the look, feel or features of the more mainstream digital mode software. At the very least single-click macros are almost a must-have for the modern digital QSO'er. Without that the level of effort for the average tester may be too high.

Another factor is "marketing", for lack of a better term. Winmor aficionados know about V4 but they are not exactly the right demographic. Indeed, when there was some initial activity most operators seemed to be from this demographic as was painfully apparent by the clumsiness of their op's compared to, for example, a seasoned PSK'er.

There is also a bit too much exclusivity. Rather than have a separate yahoo group, it might be better to move discussions to a larger venue like yahoo digital radio group. Indeed, if this mode were added to an alpha release of say fldigi or MultiPSK (and I'm not saying that's easy) adoption and testing rates would likely be far higher.

Failing all that, if V4 did something really remarkable, new and different it would become interesting. For instance, will the ARQ mode provide seamless, full-duplex chat with automatic ID? That might be interesting.

The challenge I seem to have is finding someone else on to test with. So far, I have made two contacts. first one was pretty strong, and the second one was weak and we switched to Olivia to finish our conversation.

In my humble opinion, we need to publish "net times." We could start the net using V4 and switch around with the different modes to see if there's a difference. I would really be interested in meeting with others to test this.

Thanks for your comments. I think it is worthwhile noting the current development maturity and objectives of the V4 effort.

You seem to be suggesting that V4 and its client V4Chat are ready for general “consumptions” and comparisons with all other existing digital modes. I think it is worth noting the first paper on V4 was in September (DCC 2010) and initial V4 ALPHA software testing is a bit over 6 weeks old. Not really fair to compare software maturity to PSK31 and older digital modes over 10 years old. Features like single click Macro’s, click to tune etc are easy to implement down the road but now they take time away from the important thing the V4 protocol. Well engineered protocols are more difficult to implement than the GUI of clients.

The V4 TNC implements a stand alone “software HF modem” that could be used or incorporated into any client. That is the whole idea....offering the modem and protocol to anyone that wants to integrate it into an existing client/suite. This means you don’t have to be a DSP guru to use the V4TNC. The V4Chat client has been put together so we have something to test the V4 TNC with. Bells and whistles on this initial client are not what are needed for testing and optimizing the V4 protocol. This stand alone TNC application concept has been tested and well accepted with the WINMOR TNC which is used by RMS Express, Paclink, BPQ32 and other applications.

No one is trying to “MARKET” anything. I’m looking for good solid technical feedback on some very early alpha software. There still is a lot of flexibility as to what can be incorporated into the DSP and FEC modes. I would guess that fair comparisons to production software and applications that might be a year or more off. The objective now is to wring out a very solid V4 TNC helper application that anyone is then welcome to incorporate into whatever end user application and GUI they wish. A small focused group of testers is better for this than a large group like the digital group. (I also monitor and contribute to the digital and BPQ32 groups).

Ian,

Thanks for your comments. I have been working on the ARQ mode...its more complex than FEC and requires a lot more testing. Hopefully I can get some ARQ code out for ALPHA testing this week. Just not enough hours in the day!

On your comments:

Decoding sensitivity. I am working on this and there is a tradeoff of sensitivity vs. error rate. One can be increased at the expense of the other. In the end I may have to put a control for this but for now I am trying to make it automatic. Also there is more to a successful connection than signal strength. PSK modes are good for weak signal WGN channels but notoriously worse in poor multipath channels especially NVIS. One objective on V4 is to provide good throughput in NVIS type propagation (poor multipath and Doppler). For ARQ operation for example the sensitivity can be increased because errors are suppressed by the ARQ.

Busy Detection: The busy detection is a feature built into the V4 TNC program.... The intention is to make it difficult to interfere with an existing QSO of any mode. The sensitivity of the busy detector is variable (SQUELCH) and turning the squelch up to 10 for example virtually makes the busy detector deaf. If more programs and modes tried to incorporate some form of busy detection /busy blocking we would have less interference from our digital modes.

73,

Rick KN6KB

John, one place where people seem to congregate to arrange V4 skeds is:

http://obriensweb.com/sked

On that page, click on "Digital radio" at top right.

GM Jack,

Thinking of squelch controls I have known, it seems right to me. Turning the knob CCW or "down" makes the receiver more sensitive to hearing weak signal. While turning the squelch control CW or "up" requires the incoming signal to be stronger to 'break the squelch' and be heard, effectively making the receiver more "deaf". :-)

Very well said (written)
I remember many starts of new soft (as i was always interested in new soft and new modes) ... some of them died after some week ... some were just sleepimg in the background but wer not developed further ...
Time will show how good v4 compares on air against other modes ...
Not other gui`s ... other mode!!! Just make some tests with the well known sentence from the lazy dog and the fox
Send them a few times in different modes with the same power
Compare the results (faults?)
Would like to make some similar test with the soft ... but everytime when I have some spare time for testing all others are in bed (I am in dl) ...
Maybe on the weekend?!?

Yes. Agreed. Just cut and paste some standard bla bla dogs and foxes or cats....send them back and forth several times. Make statistics.

Find some noicy switch mode powers and impose noice, then reducing noice (move away the source of the noice, use filters on and off, make notes abt what you do, and send the same file later.

Compare what other modes are the better in those various "surroundings". This may, or may not turn the results upside down.
Anyway interesting to know.

Do it mid day, greytime, evening, night time.
Listen to the Ground wave if a close co station, listen to the NVIS and Multipath changings when gradually getting darker (f.ex 80m).

This is the closest way an on air client can "simulate" a real simulation. Kind of quasi estimating parameters using statistical methods.

Give the MODE/PROTOCOL a chance to mature.

Bells as whistles (read macros or whatever) may come later, maybe even in other sw just implementing this Virtual TNC.

772. Re: V4 CHAT, ALPHA Testing, and Ham Use

Yahoo group: V4Protocol
Date: 2011-01-18 14:01:04 UTC
From: Howard Z
Topic: 755 Message: 772

Well,

If people want keyboarding with ARQ using the WINMOR TNC, it has been available for quite some time in Ham Radio Integrator (HRI) software - available in the N3ZH_Software yahoo group's files section. I had already added Macros long ago and was considering some kind of automated file transfers, but the interest was inexplicably not there.

I saw this as very useful to replace Pactor-1 TNCs used regularly in some MARS groups. A high level Mars member in the northeast had some interest, but his members seemed to prefer their Pactor-1 TNCs. Amateur Radio has a plethora of digital modes, but very few which can assure error free transmission.

I was under the impression that Rick/WDT was going to "tweak" Winmor to be better for this purpose. But instead he is creating a brand new protocol. I do not understand this decision, but it is his decision. This is his area of expertise - not mine.

The smaller bandwidth of V4 is a major disappointment to me. And this also makes me wonder why it will be embraced by the Amateur or EMCOMM community.

I had been hoping for an increased bandwidth to at least 2400 hz for Winmor as that is the digital bandwidth one sees on most modern amateur radios. Olivia and MT63 have 2000 hz bandwidth options and these have been regularly used by MARS groups. Perhaps a 2400 hz Winmor mode will rival Pactor-3 throughput? This will increase file transfer speeds both in RMS Express and also in the HRI/Winmor keyboarding where one currently can cut/paste a text file - or perhaps someday automated file transfers.

MARS often has nets that switch between Voice, keyboarding, and guaranteed error-free ARQ file/message transfers.

I envisioned a different path here for Winmor/V4.

However, I do acknowledge the monumental achievement of developing and implementing the Winmor keyboarding mode. And the Amateur Radio and Emcomm world deeply appreciates Rick/WDT's efforts.

Howard,
Thanks for your acknowledgement.

All along and thoroughly documented are the different goals of WINMOR and V4. If you haven't yet you might want to read the 2010 DCC paper on the V4Protocol reflector.

WINMOR: A Message oriented protocol (MOR = Message Over Radio) was specifically designed to be a low cost alternative for P1, P2 and P3 in message applications. It was designed to be adaptive to the channel and move message data as quickly as possible for the conditions and the selected bandwidth (500 or 1600 Hz). It was not designed or optimized as a keyboard chat mode and takes up unnecessary bandwidth for slow keyboard communications.

V4 was designed from the beginning to be a KEYBOARD QSO protocol. It is "slicker" (less latency) than WINMOR, Takes < half the space and will still deliver 50 WPM typing speed. It will fit into band segments (future?) where only 200 Hz modes are permitted. It is not designed for Message forwarding and would not (even in ARQ mode) be as effective as WINMOR in that. V4 is the result of requests during the WINMOR testing for a mode that was optimized for keyboarding.

One of the values of sound card modes is they can easily be adapted or optimized for specific purposes. (Messages, Keyboarding, Low Power beaconing, VHF, etc) No one protocol is likely to be best for all modes and trying to include every possible application as an appendage to the protocol would likely end up with the proverbial Camel (Horse designed by committee!). I chose to optimize V4 with those modulation modes and coding schemes of WINMOR that were most effective for keyboard speeds and adopted them to use minimal bandwidth. The Virtual TNC implementation of both WINMOR and V4 would easily allow an application (client or server) to select and run the desired mode with a minimum of difficulty....just like selecting between two hardware TNCs optimized for different purposes.

It certainly is possible to increase the bandwidth of WINMOR BUT you cannot always equate increased bandwidth with increased net throughput. Spreading more carriers over the spectrum reduces the power while increasing the crosstalk in each carrier (assuming a constant transmitter capability) and reduced power degrades the performance of all modes. Increasing baud rate (up to the 300 baud limit) improves throughput at the expense of bandwidth but is more susceptible to multipath propagation. Some modes like MT63 use massive redundancy which result in good FEC performance (broadcasts) but score poor on "RF footprint" (bits/Sec/Hz of Bw) and latency. One of the challenges in approaching Pactor 3 performance is not only the very powerful built in DSP (an order of magnitude or so more than most PCs) and sophisticated algorithms but also the precision hardware (e.g. Sample rate oscillator with 10 ppm accuracy) that far out strips virtually all PC sound cards. Whether you like SCS or not there is little denying it is a well engineered box with well optimized DSP firmware and it is very effective.

One thing I think most sound card mode developers would all agree on: It is the very action of designing, testing, and evaluating new modes from which we learn what works, what

doesn’t and how to build something better. So even if V4 (only 6 weeks into ALPHA testing) turns out not to be practical or better for some functions it will be a learning tool for all those that wish to participate in its development and testing. Remember in the early 1900’s there were some that wanted to close the Patent Office because “everything had been invented”. I’m not from that camp.

Rick,
You only have one father. Forget ARQ for the time being. We will all understand. Good luck.

Thanks to all those who have expressed their thoughts and prayers. My father (91) passed away peacefully Thursday evening after a long bout with Alzheimer’s. As things settle back down I’ll be able to spend some time on ham radio again and look forward to it as needed therapy.

Again thank you all for your kind prayers and comments.

73,

Rick,

I can relate to what you and your family have and are going through. Five years ago, my Dad (K6TMX) went through the same conditions although, it was diagnosed as old age dementia. What made it doubly difficult is that my Mom had to handle the pain of it all as we have been out of the area (NW Florida) for a number of years. Although I made trips out there (southern California), it wasn't like being there on a day to day basis. The bottom line is that it was a very difficult period for all of us. About a year later I had to again make frequent trips out to California to care for my Mom. Then, she also passed away. To say it was a tough time is an understatement. The pain of it all is still very fresh in my mind.

My best to you Rick.

73,

Kirk, K6KAR

P.S. My 17 year old daughter (Erin) as an Extra Class, now holds my Dad's old call.

Here is my station setup. Drake TR-7, with mods allowing DRM reception (12 KHz IF output), as well as digital HF modes. to indoor 4 foot diameter magnetic loop antenna (tunes 6200 to 18500 KHz, plus 60 meter with Tin-Foil hat added). Antenna is at 15 feet agl, in a wood frame building. This station has been successful worldwide on JT-65, as well as local 60 meter NVIS and continental range Digitial Voice (Windrm/FDMDV) .

Hi Harry,

The 12 KHz refered to is the center of the LO IF. By downconverting to a IF with a range from 0 to 24 KHz, allot of radio techniques can be programmed into the typical PC sound car DSP.

So, the common way to receive the 10 KHz wide DRM broadcasts, is to convert the last IF to 12 KHz, which makes the signal range from 7 to 17 KHz. And even though its in the audio band, its still an RF/IF signal.

There are two softwares that can take that and make it audio, that are commonly used - DREAM and SODIRA.

The DRM voice used on Ham Radio is about 2.5 KHz wide.

The 10 KHz wide DRM broadcasts have a tremendous capability at overcoming multipath. One can see the delay spread of the received signal in the DREAM software. Almost continuous, triangular shaped delay spreads at 5 msec of length are commonly copied. Vatican Radio in the evening (40 or 31 meter bands depending on season), and Radio New Zealand in the morning (on 40 meter) show this response some times of the year.

On the Drake TR-7 I added a second crystal to the BFO, and reprogrammed the switches , so that when in AM, the BFO is still on using the 12 KHz hi crystal, and the detector path is still through the product detector. This signal then goes through an OP amp buffer out to the computer. I use the same circuit for Ham Digital signals. I do not have a 10 KHz wide crystal filter, so resistors are used for that IF bandwidth, and the roofing filters have just about the right bandwidth, albeit not great rejection. So far, its not been a problem.

On Topic,

I did get on V4 on sunday, but late. I was copying KU2A very well, but was very disappointed it required so much signal to be heard. I probably wont be able to make much use of it. As 60 meters does not allow digital modes, and 40 meters NVIS is shut down again (it had a brief opening the weekend before last). Long range contacts require too much power.

I think we may need a 100 Hz wide DRM for me to have good keyboarding with my station. A shame, as I have contacts on JT-65 out to 10000 miles, yet cannot even keyboard to New Hamshire on V4 (or so I am told) with my signal....

Topic: 808 Message: 812

You need 9 or 10 kc bandwidth for receiving commercial drm on short and mediumwave ... with a center of 12kc ....

You switch the rig to am or fm (what gives you the widest filters) ... grab the last 455kc if and downmix it with 467kc (or 443) to 12kc .... feed that in the soundcard and hear errorfree music *g* (with the right software)

I have not worked with V4 for a while but was active on 14073.0, 14073.5, 7080.0 and 7080.5 in the past.

Thanks all for responding. Seems like 7073 and 14103 are the sweet spots! Now all I need to do is figure out how to call CQ and how to establish a QSO. Will sit on 14103 all day today Wed 4/13 see what happens.

There is no real active use of the application at the moment it seems. The protocol is really an FEC mode which doesn't have ARQ capability. It was in use for a while, then slowly died off while we waited for the issue of a new and improved program.

I just received my QST today, and found an announcement about Rick and a short overview of the protocol and how to join this group and download the program. As yet, I have not seen the next upgrade but it probably won't be long now before it appears.

Otherwise, go into the file section and download the full install to get your feet wet. The two frequencies mentioned are as good as any. I'd just post your intentions here with whatever frequency listed that you want to use at the moment and then monitor for a connection.

You have to join the yahoo V4Protocal group and then upon approval go to files section and download it..it is near the bottom of the list and has Dec 2010 date

Jerry,

As Ted said, you go to the Files section of the V4Protocol group to find
the software.

BUT

Yahoo groups has a quirk that won't let you do this when you first
register with a group. You have to log out of the group then login
again. THEN you should be able to find the file.

Intuitive, huh?

From: wb2lou
Topic: 839 Message: 839

Today I jumped into this V4 Chat mode and after some miss steps I was able to make a contact on 40 as well as 20 mtrs. Things went well, but there are few things I need to understand, but that will come. The QSO's were neat and fun with pretty good reliability. When the ARQ function released I suspect it will be much better.

This digital stuff is really FUN!!

I assume that by using the edit feature in the V4 Chat program for creating an outgoing CQ message that you do not need to create a new folder, just the brag file and give it a name and then simply double click on the file icon when you select paste and send. Should work just fine, all that changes is the data from a CQ to a standard brag info file......or did I miss something...

You may also simple copy and past a CQ in the send window. Then cntrl/enter.
I cannot transmit on 14.073 but will, be receiving.

From: Ted Trostle
Topic: 852 Message: 854

It would seem to me that the V4 zip did not fully unzip and/or that the set up parameters are not correct. The TNC should be there everytime. I would remove and unzip it and run it's "setup" file.

866. V4 Frequencies

Yahoo group: V4Protocol
Date: 2011-04-25 12:52:16 UTC
From: wb2lou
Topic: 333 Message: 866

Has there been a standardized list of frequencies set? I know and use 7073, 14073, 18.090, and 18.105, but it just seems that we can use any freq within the CW/RTTY regions.

But then may be there should be an operating freq range consensus for each band. Unlike RTTY and CW which are easily recognized, our mixed modes of digital signals are not, so having a set range would help our testing and enjoyment of the QSO's

Ok not a bad suggestion, if I follow your idea. However, do we want to get all jammed up on a single "73" freq.

May be I do not understand how much BW a V4 4FSK signal takes.

Take into account propagation perhaps. Take turns - it's FEC
now anyway so you'll be able to copy any transmission freely.
It's no different than RTTY per se.

There's not that many people using the Protocol so rather than
use a "hit 'n miss" approach to finding someone (as if there were
a lot to target) just use one frequency. That also gives others a
good point of reference and a known spot to check/call. When
lots more people become users, everything may spread out like
with other protocls and modes. so that others will also have
a point of reference.

There's no such thing as "standardized freqs." You'd just be
starting a simple "watering hole" for all practical intent, a common
reference point. As time goes on, there's more activity and the
ARQ aspect comes alive, then that could change. There's no reason
why you couldn't operate anywhere RTTY does, etc just dont make it
a point to take "ownership", just operate and just take turns, show some
courtesy, and play nice. Move up or down a little as needed. <GRIN>

Ok not a bad suggestion, if I follow your idea. However, do we want to get all jammed up on
a single "73" freq.

May be I do not understand how much BW a V4 4FSK signal takes.

I think there's some fear of it IMHO. Why Hams jump on one new protocol suddenly and with a furry of gusto and simply "YAWWWN" about another one is strange. There has been NOWHERE near enough activity with the V4 Protocol to warrant a judgement about its "value-added" benefit to our digital toolbox.

So, I'd park on a frequency that seems "clear" and does well, pretty much, with throwing your signal out generally and start calling CQ? Perhaps you might continually and frequently post your intentions here and also over at this page -

http://hamspots.net/arq/

Post your activity in the "ARQ" selection. V4 is basically a soon-to-be ARQ activity anyway so get the ball rolling.

Post it over on the Pactor_Packet forum that I belong to. It's an ARQ group -

Take a peek, join if you like -

http://groups.yahoo.com/group/pactor_packet/

You could post in the forum if you join us.

Then, keep up the chatter about the mode, keep transmitting, making skeds, etc etc which Im sure you know.

The 20 Meter band is in pretty bad shape today, at least from Washington State. I thought I would give V4 a try again
after seeing all the postings. So after updating to the latest revision of V4 I started calling on
14073.0. In about 15 minutes of trying, I may have had ONE attempt possibly from WB2LOU but not sure because the deep QSB swings
only allowed about 5 words of print and that was it. Bang! gone.

Admittingly, I did not post my intensions.. just jumped in to see if anyone was listening.

Hi Peter. Looooong time no hear.....:-) I have a sick cable and or a sick g5rv. Want to renew at home and get one at vacation qth west coast.
Lurking in background.

I will as well install this 200hz narrow qso mode in due time, as I also did with RMS Express. And also AirMail as I remember you told me about years ago.

I believe that an arq mode that narrow may really have the right of living, as one does not need a broader or quicker mode than the ability to type.

As you probably know the 15 years running of Synapse (1) is taken down at LA3F and we do build RMS WINMOR and RMS Pactor stations. More bands slowly coming. Try WINMOR at evening and Night.
We have clients from all EU countries. Same antenna as we used on Pactor1 back then on 80m.

In addition 7xq and I are are making Synapse 2 which is voice comm and full control of choice of any nearby repeater or even all ssb HF bands as well. Server needs linux synapse server, + skype, but clients on all platforms do need only their standard skype client. Even all cell phones.

We can later arrange future listening options for you when connecting on any band. More advanced than when you ran pactor1 and I ran 2m packet in a live qso at some NRRL days abt 15 years ago, hi.

You still have the wonderful loops, or are they all split up?

The V4 TNC software is time critical and requires tight coupling of the OS and the sound card DSP processing software. I would be surprised if it works well on a Windows emulator. When I get some time (I have been swamped with other matters) I will gladly work with an experienced Linux/C programmer to help port the V4 and WINMOR TNC code to Linux. But it is not a trivial exercise (read will take man months of work) and needs to be supported down the road. I am currently working on the V4 ARQ mode and would like to get that working before getting involved in any porting activity.

Rick yes I know its a lot of work. Timing is critical as is with other
communications software especialy using ARQ.
So you are working on that. What about the porting of V4 and winmor TNC.
dou you have the sourcecode, also of the RMS of Winmor?
That would be great.
Let me know.

Karel,

Not sure what you mean by the “RMS of Winmor”? There is already RMS WINMOR (server for Winlink 2000), BPQ32 (incorporates a WINMOR channel) and RMS Express (WINMOR, Packet, Pactor, Robust packet, Telnet client). W are working on (I am not doing initial alpha testing) of an RMS Trimode server (WINMOR, Pactor 1,2,3, and Robust Packet). The latter will allow scanning of multiple frequencies (up to 3 at a given time) and accept connections for those three HF protocols.

Re porting: All the code is written in VB.NET 2010 and includes multi threading and uses the Microsoft Direct X for sound card control (that direct X will of course need to be changed to be compatible with the sound card driver interfaces in Linux).

If you are interested I will send you a package of some of the VB code. This is pretty simple code (Reed Solomon encoder/decoder, Viterbi decoder, and basic FFT code). These represent perhaps about 10% of the coding effort and should all transfer fairly easily to C or using some form of bridge software (Mono etc). If you can make all those work and test them you have a start on the porting effort but it does not include any of the complex real time timing or multi threading. So far those that I have sent the sample package to have not delivered anything... I suspect they were more hackers than real programmers but as you know this stuff takes a lot of time and the last thing we want is for a half baked and poorly supported implementation of Linux WINMOR out there. It will just cause a lot of headaches.

Rick,

Let me introduce myself first. I am an electrical engineer, telecom. I am working, living with my family in Ecuador. I have a small company working in telecoms. I have a special interest in datacomunications on HF and VHF/UHF. I am interested getting an opensource windows, Linux solution for data and mail transfer for emergency and utility communicatios with a free spinoff for amateur radio.

At this moment exist several approaches doing so:

-Packet Q15X25, multitone, using soundcard in windows and Linux, open source. Tested the software on both platforms, works, but because of the overhead its slow.

-Pactor, I,II,III, and now 4 (will be released in July) using special modem in Windows, Linux, closed. Good for IP traffic but source. Works but its all closed hardware and protocoll. No good software available under Linux.

-Winmore RMS express and server, unsing soundcard emulation a TNC and modem (pactor and packet) in Windows. Tested and works ok. Only windows, no code for Linux. I would change some features, one of the most importand is the choice of the Internet/mail gateway. Now you rely on several mailservers selected, but your not free to make your own net.

-V4 Chat, using soundcard in windows. No code for Linux. Some features in the config I would change, f.i. The text in the receive windows contains also the errors, this I would chose to leave only to the text corrected. I tested the software very nice but no Linux. Would be great if connected to internet chat. Porting it to Linux will still be a lot of work. ARQ version would be nice, but I don't see this as a priority.

-RFSM2400, emulation Milstd.188-110 serialtone, and modifications, using soundcard in Windows, closed source. (shareware, free of charge) I tested this software and helped develop as alfa tester.

-RFSM800,emulation Milstd.188-110 serialtone and modifications, using soundcard in Windows, closed source.(shareware licence) Works fine, but no all pc's and soundcards (timing) I tested this software and helped develop as alfa tester. Not good for IP traffic without a proxy. As far as I have tested only one version 2400) permits IP proxy.

-HF Modem emulation Milstd.188-110 serialtone soundcard, on Linux platform, not ready, a bit outdated. (I have the sourcecode) I did not test this software and its not up to date.

-WinDRM, multitone modem (QAM) data and voice, based on DRM standard for broadcasting, on Windows (open source) code available for windows. I tested this software. It works fine but no Linux vesion is available. Does not work under Wine. Porting it to Linux will be a lot of work. Not realy good for IP traffic without the use of a proxy. (to much latency)

Most of the software runs on a windows platform. Running this software under wine is critical because of timing. Besides not all software will run in wine.

If Winmor RMS, server and client would be available in Linux this is a very good candidate for mail and file transfer. Should be free for non commercial use. Features have to be optimised for commercial and utility use. It would be the ideal solution for Emergency networks.

Rick if I get the code available of the V4 and WinmorRMS (express) server and client, I would go looking for funding, together or allone. Overhere in Ecuador I have good programmers for Linux and windows. However working for free in a third world country is a fantasy. People should earn a little bit, they need it. I have several contacts to local universities and politecnics and students interested in a thesis project. We need a projectcoordinator and a formal project. I could be the coordinator of the project, but funding is needed. One of the strong items is the availability of programmers and the need for development. Many regions in Latin America have no access to mail or the internet for utility (NGO's) Indian villages, medical centres, government and non government agencies (emergency trafic as a backbone) and commercial traffic. Satelite is the only option up to now.

I would be glad to cooperate and receive your material 'as is'. If your interested we open a project and coordinate software development. Splitting up the software in modules and putting it all together, testing it in the real world and distributing it.

[Big snip of very interesting approaches]

Karel,

Another approach you should seriously consider is pskmail:

http://www.pskmail.org/

This can do everything you are looking for. It is very flexible,
adaptive to traffic and interference, well established and working
today, and coded in Windows and Linux.

Hello Ian,
How could I forget to mention PSKmail. Your right a good solution, but not fast enough for what we need. If they would integrate a fast serial of paraleltone modem it would be ideal. However I wrote with the developers of the code, system. they welcome the idea but are not very interested to leave the 500Hz bandwith, the PSK500 is running on at this moment. If we could have a PSK1000, PSK1500 and a PSK2000 it would be great, but as I wrote the developer of the FLDIGI is no prepared to work on it. Your right I will have to evaluate a FLDIGI modification to incude a faster protocoll. If someone has a good idea to do so. I am all interested.

895. Re: [V4Protocol] V4 on Linux

Yahoo group: V4Protocol
Date: 2011-04-27 19:03:11 UTC
From: Rick Muething
Topic: 884 Message: 895
Attachments: 1 described; binary payloads are missing from this source WARC

Karel,

First, (and important) WINMOR and V4 are licensed ONLY for non commercial (Ham or MARS) use. There is no commercial use of either the software or the WINMOR or V4 protocols permitted without a specific license from the Amateur Radio Safety Foundation Inc. www.arsfi.org (This is a 501C3 Public charity that holds the rights to all the WINMOR, V4, RMS Express, RMS WINMOR etc software). It is donations to this 501C3 (both corporate and individual) that we use to pay for the real costs (not donated volunteer labor) of the WL2K system and the various required 3rd party licenses.

If we do, permit or support a Linux version it MUST be under those same license constraints.

Second: If you want to go ahead and work on a Linux equivalent I would strongly suggest partitioning the software into two separate and independent components:
1) The virtual TNC. This is like the WINMOR TNC or V4 TNC code. It ONLY implements the bit level protocol. It has nothing to do with the application, displays, forwarding message layer protocol etc. This permits others to use the virtual TNC and construct their own application(s). The BPQ32 is a good example of how this works. John Wiseman took the public WINMOR TNC code and a fairly simple interface document and integrated the WINMOR mode into BPQ32. Since it is a Windows application it uses the released WINMOR TNC as is (no modifications). The virtual TNC (Both WINMOR and V4) interface using a pair of simple TCPIP ports on the local computer (it theory it doesn't need to be local but TCP Packet timing could then become more critical). This insures it is compatible with other applications using the WINMOR TNC (there are now a handful). The attached zip has some documentation on how the WINMOR Virtual TNC is used and interfaced.

2) The application (Client, server or like RMS Express a program that can be both client and server with some message addressing restrictions). Making a client is a very personal sort of thing and it can range from a full blown client like RMS Express (all modes, built in message editing, display, management, radio control, propagation prediction etc) to something much simpler piggy backing on some existing email client. None of these functions should deal with the bit level protocol (WINMOR, Packet, Pactor etc) those should all normally be done by the TNC (or virtual TNC e.g. WINMOR TNC). One thing that is for certain....a client application requires a lot of support for users: help, forums, updates etc. This I can speak from experience (we have developed 3 or 4 user clients over the past several years).

The reason that the SCS P2, P3 and P4 protocols are not open is this is a private company, they spent many engineering man years developing and refining Pactor and they have shareholders to answer to. I am certain they are not going to give away the company jewels using open source or free licenses. The same goes for Harris and Motorola HF modems. MIL Std 188 (STANAG) is a different story but that has limitation and cannot be used in many band segments of the US (symbol rate exceeds 300 baud).

One thing I can tell you having now done several sound card type protocols (SCAMP, WINMOR, V4) is there is a tremendous amount of time testing and tweaking these protocols for performance and robustness. If one develops a second implementation (e.g. Linux) version of a sound card protocol is will be essential to develop a very thorough and automatic verification mechanism to insure it is a compatible implementation of the same protocol (e.g. A Linux and Window WINMOR implementation can talk to each other without any problem). This means structuring testing scenarios and verification through repeatable simulated HF channels. (using a HF channel simulator)

The V4 mode was designed specifically for keyboard chat to support typical manual typing speeds. It is slicker (faster turn around), does not use compression, can handle multi byte UTF-8 characters, and occupies only 200 Hz bandwidth. The V4 ARQ mode COULD be used for messages (attachments not practical with this speed) but using WINMOR's 500 Hz mode would probably be much better unless the 200 Hz bandwidth was an absolute requirement.

I have attached a zip containing the initial test source for WINMOR. This part is all based on public code and should be a slam dunk to translate and test. Consider it something like 5-10% of what I would estimate as the porting effort. It should give you a feel for what is involved but the real DSP (modulation, demodulation, tuning, etc) and bit level protocol code is considerably more complex.

One suggestion is if you are going to piggy back on an existing "standard" (e.g. HF Packet, Pactor 1, Q15X25) make sure you do your homework and really test (in a controlled environment using a HF simulator) how fast and robust the mode is. The world does not need another easy to implement but inferior HF mode like HF packet!

Let me know your thoughts and intentions.

73,

Rick KN6KB

The V4 TNC software is time critical and requires tight coupling of the OS and the sound card DSP processing software. I would be surprised if it works well on a Windows emulator.

When I get some time (I have been swamped with other matters) I will gladly work with an experienced Linux/C programmer to help port the V4 and WINMOR TNC code to Linux. But it is not a trivial exercise (read will take man months of work) and needs to be supported down the road. I am currently working on the V4 ARQ mode and would like to get that working before getting involved in any porting activity.

Subject: Re: [V4Protocol] V4 on Linux

I tried and it wil niet work under wine. If anybody succeeds let e know.

I woud appreciate if this code would be native under Linux, but that wil not be easy. Has anybody tried geeting the code to be ported to Linux?
Greetings
Karel

Hi All...
Has anyone been able to run V4 on Linux under Wine
I can get it to install but wont work as i need VB8
will try and install that and see if i can get it to work

902. FT-450 control

Yahoo group: V4Protocol
Date: 2011-05-02 23:35:07 UTC
From: cr88a
Topic: 902 Message: 902

Having a problem getting the V4Chat to control the rig, suspect I'm not understanding the instructions.

I have been running psk, jt65, rtty, and Olivia with this setup, which is a Windows 7 32 bit system with actual serial port cards and a Yaesu FT-450AT. I've been runing Mixw, FLdigi and HRD. PCC-450 also works. I've turned off all software firewalls.

Problem is, with nothing else running V4Chat doesn't control the rig and the two tone test doesn't do t/r switching.

I've set the "radio control" parameters to COM3, 19.2 and RTS, same as HRD.

In trying to understand the Help instructions I see under the "Radio Control" section of the setup "Radio Command (some radios) through the Radio Control Port. " Now this paragraph, which describes the t/r method I intend to use, doesn't specify how to set the PTT Port (optional) parameter. I've tried setting it to "external" and to COM3 with all possible RTS and DTR combinations on "Radio Control Port" and PTT Port (optional). I also tried setting "Radio Control Port" to None and PTT Port (optional) to COM3 with all combinations of RTS and DTR.

I think this "Radio Command" paragraph is saying that when set to FT-450 the V4Chat should read the frequency and do t/r...it doesn't and I don't know what to do next.

I'm also not sure what the Help is saying with troubleshooting port conflicts. The chat program is telling me the TNC is OK on port 8510. Does that in fact mean the chat is communicating with the virtual TNC? Do I have to open up the port in the router that connects this computer to the LAN and WAN?

FEC loopback works fine.

Thanks for any help.

903. Re: [V4Protocol] FT-450 control

Yahoo group: V4Protocol
Date: 2011-05-03 13:00:36 UTC
From: Rick Muething
Topic: 902 Message: 903

Pete,

If the loop back is working OK and the program reports the TNC is OK on the port you have set then the TNC is working fine. Those TCP ports are how the V4Chat program communicates with the V4 Virtual TNC.

Re PTT control:
First understand there are basically 3 modes possible for PTT control.
1) Radio control (some radios) I don't know if the FT-450 supports this. Some modern radios (most Icoms) do. This is a serial command to the radio control port that tells the radio to transmit or not. If you radio supports PTT control this is convenient since you only need one serial port (the same serial port also programs the frequency, mode etc). be sure and use at least 4800 baud for timing reasons.
2) PTT via VOX (external). This method keys the PTT via the audio. It is used on some sound card interfaces (e.g. SignaLink) or if you have VOX set in the transceiver to key off the transmitted audio. When this is selected the programs adds about 120 ms of additional leader to compensate for the delay VOX keying introduces.
3) Direct PTT keying via RTS or DTR lines. This uses a separate (not the same port used to program the radio's frequency) RS232 port to key the VOX from either the RTS or DTR lines. Those lines may need level conditioning to actually key the PTT line (usually an open collector to 5 volts or such). Some sound card interfaces use this.

Hope this helps.

From: Pete Ferrand
Topic: 902 Message: 904

Rick, thanks for getting back to me.

So the loop back means that part I understand and is working.

As to t/r switching, I was hoping to use method (1) to avoid tying up another port and since the vox on the rig is disabled in data modes.

With the other programs, MixW, HRD, FLdigi, the radio responds to a command to do t/r switching as well as commands to read frequency, change vfo's, etc. through the same port, com3 in this case.

Does V4 work differently?

Further, for method (1) if I set "Radio Command" to com3, what do I set "PTT Port (optional)" to?

Thanks again.

-Pete

Pete,

If the loop back is working OK and the program reports the TNC is OK on the port you have set then the TNC is working fine. Those TCP ports are how the V4Chat program communicates with the V4 Virtual TNC.

Re PTT control:
First understand there are basically 3 modes possible for PTT control.

Pete,

Yes I will have to double check the code but I am pretty sure in V4 the same com port is not used to send both the serial control commands and to key the PTT with DTR or RTS. While I know some sound card interfaces do that there are a number of radios that require DTR and/or RTS be in specific states and do not allow using them simultaneously with the normal serial control port. Part of the issue here is that for ARQ modes (which V4 will have soon and WINMOR already has) it is important to carefully control any delay introduced to the PTT) and using some of these interfaces does introduce unacceptable delay (in ARQ you must switch back and forth rapidly between sending and receiving).

Pete,

One of the setups is to use the CAT command to key the PTT. IF your radio supports it. Try selecting one of the other Yaesu models if yours isn't listed.

Can you send me the details of the CAT command for the FT-450? Basically I need the command info for:
PTT On/OFF
Set Frequency
Set mode (LSB, USB etc)

An electronic copy of the CAT manual will be best.

Subject: Re: [V4Protocol] FT-450 control

Pete,

Yes I will have to double check the code but I am pretty sure in V4 the same com port is not used to send both the serial control commands and to key the PTT with DTR or RTS. While

I know some sound card interfaces do that there are a number of radios that require DTR and/or RTS be in specific states and do not allow using them simultaneously with the normal serial control port. Part of the issue here is that for ARQ modes (which V4 will have soon and WINMOR already has) it is important to carefully control any delay introduced to the PTT) and using some of these interfaces does introduce unacceptable delay (in ARQ you must switch back and forth rapidly between sending and receiving).

Subject: Re: [V4Protocol] FT-450 control

Rick, thanks for getting back to me.

So the loop back means that part I understand and is working.

As to t/r switching, I was hoping to use method (1) to avoid tying up another port and since the vox on the rig is disabled in data modes.

With the other programs, MixW, HRD, FLdigi, the radio responds to a command to do t/r switching as well as commands to read frequency, change vfo's, etc. through the same port, com3 in this case.

Does V4 work differently?

Further, for method (1) if I set "Radio Command" to com3, what do I set "PTT Port (optional)" to?

Thanks again.

-Pete

Pete,

If the loop back is working OK and the program reports the TNC is OK on the port you have set then the TNC is working fine. Those TCP ports are how the V4Chat program communicates with the V4 Virtual TNC.

Re PTT control:
First understand there are basically 3 modes possible for PTT control.
1) Radio control (some radios) I don’t know if the FT-450 supports this. Some modern radios (most Icoms) do. This is a serial command to the radio control port that tells the radio to transmit or not. If you radio supports PTT control this is convenient since you only need one serial port (the same serial port also programs the frequency, mode etc). be sure and use at least 4800 baud for timing reasons.
2) PTT via VOX (external). This method keys the PTT via the audio. It is used on some sound card interfaces (e.g. SignaLink) or if you have VOX set in the transceiver to key off the transmitted audio. When this is selected the programs adds about 120 ms of additional leader to compensate for the delay VOX keying introduces.
3) Direct PTT keying via RTS or DTR lines. This uses a separate (not the same port used to program the radio’s frequency) RS232 port to key the VOX from either the RTS or DTR lines. Those lines may need level conditioning to actually key the PTT line (usually an open

collector to 5 volts or such). Some sound card interfaces use this.

Hope this helps.

Subject: [V4Protocol] FT-450 control

Having a problem getting the V4Chat to control the rig, suspect I'm not understanding the instructions.

I have been running psk, jt65, rtty, and Olivia with this setup, which is a Windows 7 32 bit system with actual serial port cards and a Yaesu FT-450AT. I've been runing Mixw, FLdigi and HRD. PCC-450 also works. I've turned off all software firewalls.

Problem is, with nothing else running V4Chat doesn't control the rig and the two tone test doesn't do t/r switching.

I've set the "radio control" parameters to COM3, 19.2 and RTS, same as HRD.

In trying to understand the Help instructions I see under the "Radio Control" section of the setup "Radio Command (some radios) through the Radio Control Port. " Now this paragraph, which describes the t/r method I intend to use, doesn't specify how to set the PTT Port (optional) parameter. I've tried setting it to "external" and to COM3 with all possible RTS and DTR combinations on "Radio Control Port" and PTT Port (optional). I also tried setting "Radio Control Port" to None and PTT Port (optional) to COM3 with all combinations of RTS and DTR.

I think this "Radio Command" paragraph is saying that when set to FT-450 the V4Chat should read the frequency and do t/r...it doesn't and I don't know what to do next.

I'm also not sure what the Help is saying with troubleshooting port conflicts. The chat program is telling me the TNC is OK on port 8510. Does that in fact mean the chat is communicating with the virtual TNC? Do I have to open up the port in the router that connects this computer to the LAN and WAN?

FEC loopback works fine.

Thanks for any help.

I'll be at work 'til late. I think it's the same as the -950. Perhaps some of the other members of the group can help. Also at the Yaesu website there's a full manual on the CAT system for the FT-450 and other rigs.

Pete,

?

One of the setups is to use the CAT command to key the PTT. IF your radio supports it.? Try selecting one of the other Yaesu models if yours isn’t listed.

?

Can you send me the details of the CAT command for the FT-450?? Basically I need the command info for:

PTT On/OFF

Set Frequency

Set mode (LSB, USB etc)

?

An electronic copy of the CAT manual will be best.

Hi Rick:

Thanks, still confused. I would hope that since these other programs send a cat command to do t/r switching you could do the same thing. I'd prefer not to use DTR/RTS if possible and I haven't used it thus far. I don't use an interface as such with any of these other programs.

I have used ARQ with AMTOR years ago and I miss it, I think it will be great improvement when you get it going, a great improvement over PSK31.

Again, the best thing is to send a cat command to the rig. Can you do this? I'd think that is what happens when I select FT-450 in the config.

Again, for method (1) if I set "Radio Command" to com3, what do I set "PTT Port (optional)" to?

Hi Pete

Agreed. Yes, it will be interesting to try V4 when Rick has implemented
ARQ.

However, are you aware of PSKmail?

http://www.pskmail.org/

This supports ARQ on top of fldigi, and is particularly interesting
because the system adapts to band noise and conditions -- connections
can start off at high speed PSK, but then switch automatically to a
lower speed, or even to an entirely different mode, when the going gets
harder.

Despite its name, PSKmail isn't just for reliable mail transfer -- it
also has an ARQ chat mode.

PSKmail is well established, and already does well what I suspect Rick
is trying to do. I think you'll find PSKmail is worth a look.

It is used on some sound card interfaces (e.g. SignaLink) or if you have VOX set in the transceiver to key off the transmitted audio. When this is selected the programs adds about 120 ms of additional leader to compensate for the delay VOX keying introduces.
3) Direct PTT keying via RTS or DTR lines. This uses a separate (not the same port used to program the radio’s frequency) RS232 port to key the VOX from either the RTS or DTR lines. Those lines may need level conditioning to actually key the PTT line (usually an open collector to 5 volts or such). Some sound card interfaces use this.

Hope this helps.

Subject: [V4Protocol] FT-450 control

Having a problem getting the V4Chat to control the rig, suspect I'm not understanding the instructions.

I have been running psk, jt65, rtty, and Olivia with this setup, which is a Windows 7 32 bit system with actual serial port cards and a Yaesu FT-450AT. I've been runing Mixw, FLdigi and HRD. PCC-450 also works. I've turned off all software firewalls.

Problem is, with nothing else running V4Chat doesn't control the rig and the two tone test doesn't do t/r switching.

I've set the "radio control" parameters to COM3, 19.2 and RTS, same as HRD.

In trying to understand the Help instructions I see under the "Radio Control" section of the setup "Radio Command (some radios) through the Radio Control Port. " Now this paragraph, which describes the t/r method I intend to use, doesn't specify how to set the PTT Port (optional) parameter. I've tried setting it to "external" and to COM3 with all possible RTS and DTR combinations on "Radio Control Port" and PTT Port (optional). I also tried setting "Radio Control Port" to None and PTT Port (optional) to COM3 with all combinations of RTS and DTR.

I think this "Radio Command" paragraph is saying that when set to FT-450 the V4Chat should read the frequency and do t/r...it doesn't and I don't know what to do next.

I'm also not sure what the Help is saying with troubleshooting port conflicts. The chat program is telling me the TNC is OK on port 8510. Does that in fact mean the chat is communicating with the virtual TNC? Do I have to open up the port in the router that connects this computer to the LAN and WAN?

FEC loopback works fine.

Thanks for any help.

Hi Rick:

You can download the CAT manual from the Yaesu site at:

http://yaesu.com/indexVS.cfm?cmd=DisplayProducts&ProdCatID=102&encProdID=870B3CA7CFCB61E6A599B0EFEA2217E4&DivisionID=65&isArchived=0

Then just click on the Files section. I tried the 450 and 950 selection on V4 without success.

73,

-Pete

Subject: Re: [V4Protocol] FT-450 control

Pete,

One of the setups is to use the CAT command to key the PTT. IF your radio supports it. Try selecting one of the other Yaesu models if yours isn’t listed.

Can you send me the details of the CAT command for the FT-450? Basically I need the command info for:
PTT On/OFF
Set Frequency
Set mode (LSB, USB etc)

An electronic copy of the CAT manual will be best.

Subject: Re: [V4Protocol] FT-450 control

Hi Rick:

Thanks, still confused. I would hope that since these other programs send a cat command to do t/r switching you could do the same thing. I'd prefer not to use DTR/RTS if possible and I haven't used it thus far. I don't use an interface as such with any of these other programs.

I have used ARQ with AMTOR years ago and I miss it, I think it will be great improvement when you get it going, a great improvement over PSK31.

Again, the best thing is to send a cat command to the rig. Can you do this? I'd think that is what happens when I select FT-450 in the config.

Again, for method (1) if I set "Radio Command" to com3, what do I set "PTT Port (optional)" to?

Subject: Re: [V4Protocol] FT-450 control

Pete,

Yes I will have to double check the code but I am pretty sure in V4 the same com port is not used to send both the serial control commands and to key the PTT with DTR or RTS. While I know some sound card interfaces do that there are a number of radios that require DTR and/or RTS be in specific states and do not allow using them simultaneously with the normal serial control port. Part of the issue here is that for ARQ modes (which V4 will have soon and WINMOR already has) it is important to carefully control any delay introduced to the PTT) and using some of these interfaces does introduce unacceptable delay (in ARQ you must switch back and forth rapidly between sending and receiving).

Subject: Re: [V4Protocol] FT-450 control

Rick, thanks for getting back to me.

So the loop back means that part I understand and is working.

As to t/r switching, I was hoping to use method (1) to avoid tying up another port and since the vox on the rig is disabled in data modes.

With the other programs, MixW, HRD, FLdigi, the radio responds to a command to do t/r switching as well as commands to read frequency, change vfo's, etc. through the same port, com3 in this case.

Does V4 work differently?

Further, for method (1) if I set "Radio Command" to com3, what do I set "PTT Port (optional)" to?

Thanks again.

-Pete

Pete,

If the loop back is working OK and the program reports the TNC is OK on the port you have set then the TNC is working fine. Those TCP ports are how the V4Chat program communicates with the V4 Virtual TNC.

Re PTT control:
First understand there are basically 3 modes possible for PTT control.
1) Radio control (some radios) I don't know if the FT-450 supports this. Some modern radios (most Icoms) do. This is a serial command to the radio control port that tells the radio to transmit or not. If you radio supports PTT control this is convenient since you only need one serial port (the same serial port also programs the frequency, mode etc). be sure and use at least 4800 baud for timing reasons.
2) PTT via VOX (external). This method keys the PTT via the audio. It is used on some sound card interfaces (e.g. SignaLink) or if you have VOX set in the transceiver to key off the transmitted audio. When this is selected the programs adds about 120 ms of additional leader to compensate for the delay VOX keying introduces.
3) Direct PTT keying via RTS or DTR lines. This uses a separate (not the same port used to program the radio's frequency) RS232 port to key the VOX from either the RTS or DTR lines. Those lines may need level conditioning to actually key the PTT line (usually an open collector to 5 volts or such). Some sound card interfaces use this.

Hope this helps.

Thanks Pete, first attempt at V4 QSO. Bad fading on 20 meters this morning.

Using an Icom 9100 here, once setup correctly for rig/rate/ports/levels things seemed to be working just fine. Seems to need less audio out and more audio in that HRD modes, or JT65-HF.

Hope to bump into you when conditions are better.

V4 always uses 4FSK (one tone out of 4 possible for 2 bits per symbol). Unlike WINMOR it does not do mode shifting. Its goal is to provide the most robust mechanism that fits into 200 Hz and supports modest typing speed (40-50 WPM).

I am working on a new release that uses interleaving for some significant improvement in robustness and including ARQ. I may release the Interleaved version before the ARQ. The only problem is we will all have to switch over to the latest version. The interlaced version is not compatible with the current version on the reflector. Interleaving creates a significant improvement on multipath and fading channels like we see on HF. It has no benefit (or harm) on white noise channels.

I hope to make an announcement of the new version this week.

Abel.

Do you hear anyone answering your CQ? To get a reply:

1) Someone must be listening on your frequency (within the tuning range they have set up).
2) The signals must be strong or clean enough to be decoded.
3) They must answer you and you must be able to decode their signal. If you can't hear their reply it is not likely you can decode it.

Red letters with strikethrough indicate data received but failed the CRC check (FEC could not correct all the errors). For FEC modes you can't do anything about this though you may be able to read some of the Red data that was not clobbered. When the ARQ mode is operational (I am working on it) it will automatically repeat until it is corrected so will only print corrected data.

Read the help and papers on V4 for more information.

925. A few brave soles need to test the new V4 ARQ version

Yahoo group: V4Protocol
Date: 2011-05-23 20:32:21 UTC
From: Rick Muething
Topic: 925 Message: 925

All,

I am in the final stages of testing the new V4 ARQ mode. This is a nice improvement allowing two stations to exchange error free data (after FEC and ARQ) even in pretty poor conditions. I am in the final stages of testing and updating the help files for V4 and V4Chat. ARQ is a few percent slower than FEC (due to the ACK/NAK) but gives perfect copy (or no copy at all if things are really bad!).

I would like a few (no more than 5) brave individuals with some experience with the V4 FEC mode to test out the install, help and test ARQ and FEC operation before posting the files for the entire group (there is always something that will go wrong!)

One important thing on this new version: I am going to an interleaved transmission scheme (where the symbols are sent in a more randomized order and then deinterleaved at the receiver). My testing of this over many different channel types suggests it offers some significant improvement especially on burst noise, multipath and static crashes over the non interleaved version that was used before. The only downside to interleaving is that it is NOT compatible with the current posted version so it will require an update. The interleaved version is the same speed, same 200 Hz bandwidth and sounds exactly the same as before .only the order of symbol transmission is changed. The new version 0.2.0.0 will include Monitor, FEC and ARQ modes

If you are game for this and want to try and set up some test FEC or ARQ session I would appreciate it.

If interested contact me directly at rmuethingATcfl.rr.com and I will send you a zip package later this week. Thanks.

Subject: [V4Protocol] A few brave soles need to test the new V4 ARQ version

All,

I am in the final stages of testing the new V4 ARQ mode. This is a nice improvement allowing two stations to exchange error free data (after FEC and ARQ) even in pretty poor conditions. I am in the final stages of testing and updating the help files for V4 and V4Chat. ARQ is a few percent slower than FEC (due to the ACK/NAK) but gives perfect copy (or no copy at all if things are really bad!).

I would like a few (no more than 5) brave individuals with some experience with the V4 FEC mode to test out the install, help and test ARQ and FEC operation before posting the files for the entire group (there is always something that will go wrong!)

One important thing on this new version: I am going to an interleaved transmission scheme (where the symbols are sent in a more randomized order and then deinterleaved at the receiver). My testing of this over many different channel types suggests it offers some significant improvement especially on burst noise, multipath and static crashes over the non interleaved version that was used before. The only downside to interleaving is that it is NOT compatible with the current posted version so it will require an update. The interleaved version is the same speed, same 200 Hz bandwidth and sounds exactly the same as before .only the order of symbol transmission is changed. The new version 0.2.0.0 will include Monitor, FEC and ARQ modes

If you are game for this and want to try and set up some test FEC or ARQ session I would appreciate it.

If interested contact me directly at rmuethingATcfl.rr.com and I will send you a zip package later this week. Thanks.

73,

Rick Muething, KN6KB

932. V4 Interleave

Yahoo group: V4Protocol
Date: 2011-05-24 11:45:19 UTC
From: Daniel V. Wolff, Jr.
Topic: 932 Message: 932

Hello Rick.

I have a question about the interleave method you are using? I think I understand the term "interleave" but I'd like to be sure, as you've implemented it.

In the RTTY days of old there used to be something frequently used in commercial and military called a "Time-Division Multiplexer" or also the "Time Diversity Modem" (TDM). The one we TDM is a mode resembling FEC AMTOR. TDM uses one sub-carrier, but assigns separate data channels to different time slots. The MD-1142 (aka TDM BR 6029C) has two modes of operation both are full duplex (the receiver and transmitter sections are fully independent), in the Internal Multiplexer Mode a single TTY signal is fed to 7 different channels and the signal in each channel is time delayed by 1 second form all the other channels. In addition there is a pilot tone at 561.1 Hz and the MARK/SPACE FSK shift of each tone was 85 Hz (if I recall). This mode of operation provides a high probability of getting the message through. In the External Multiplexer Mode each of the 8 channels is fed or receives a separate data stream so it does not have the redundancy of the IMM. In time order the channels are:

Chan # Center Freq Delay sec.

3 1530 Hz 0

7 2890 Hz 1

1 850 Hz 2

4 1870 Hz 3

6 2550 Hz 4

2 1190 Hz 5

5 2210 Hz 7

8 561.1 Hz pilot tone

Each of the channels transmitted the same information but each delayed by 1 second. The receiving TDM would receive all channels but vote on the best five matching channels to give an output. The redundant transmitted data on different tone pairs with the delay insured to get the data through on noisy channels. The result was an error free transmission nearly every time. The TDM worked very well for RTTY and I always thought they'd be good for implementation for the new PSK modes used in ham radio but never saw them. There is an initial 8 second latency from the start of transmission but that was never a problem for a long broadcast. Do you remember the TDM? They

were pretty slick.

Anyway, does your interleave work in a similar manner, assigning the same data to different channels with a delay between channels? I'd like to understand better how you've implemented the interleave process in V4.

Also, could you send me the V4 ARQ version so I can test it in Europe? Thanks.

934. Re: [V4Protocol] V4 Interleave

Yahoo group: V4Protocol
Date: 2011-05-24 13:27:56 UTC
From: Rick Muething
Topic: 932 Message: 934

Daniel,

What you described is truly Time division multiplexing but using redundant interleaved data streams. That is not what is being used in V4. Here interleave is being used in the common code term where the sequence of code symbols is rearranged (interleaved) to achieve a specific purpose.

The reason for interleaving coded symbols has to do with the type of Error correcting code used and the expected type of channel errors. In V4 a fairly powerful Viterbi code of rate 1/2 K=7 code is used (sometimes called the Viking code after the Viking spacecraft that used it). The Rate 1/2 means that the code contains 1 FEC (error correcting) bit per each bit of information (in other words the code expands the data by a factor of 2). The length 7 means that the convolutional code used spreads each symbol out over 7 symbol times in an overlapping sequence).

Now the Viterbi decoder is very powerful on random errors but clusters of errors (2 or more errors in a row) significantly reduce the strength of the FEC code and cause more symbol decode errors. One way to improve on this is to take the Viterbi encoded symbols (in V4 there are 126 such 2 bit symbols per data frame) and instead of sending them in the normal order (as they come out of the Viterbi encoder) scramble them in some different sequence. In this version I am using what is called a simple block interleaver to do this. So instead of sending the Viterbi encoded symbols in normal sequence 1,2,3, ...126. They are sent “interleaved” like 1,10,19,28,...2,11,20,29....126. Now the receiving station (knowing the interleave mechanism used) simply re orders the received symbols back to their original Viterbi order BEFORE trying to decode them using the Viterbi decoder. You can see if there were a burst error during transmission say from static where 5 sequential symbols were wiped out this would now be spread in time to the same 5 errors but spread out in time (non adjacent). The Viterbi decoder handles these more randomly distributed errors much better. The net result is a decrease in frame error rate for burst, static and short term multipath errors. In simulations over thousands of frames I saw an improvement in frame success from about 50% (no interleave) to near 80% (interleaved) over poor channels (S/N = −5dB, CCIR Multipath poor channel). That is equivalent to about doubling your transmission power. For random white noise Interleaving is no benefit (but doesn’t harm) but most HF propagation is much worse than white Gaussian noise channels.

The only downside to interleaving is that you must capture and store all the interleaved symbols before decoding. For V4 this is not a concern since there are only 126 symbols per frame and the frame is not decoded until the entire frame is captured.
Hope this helps answer your question. Here is a Wikipedia reference
http://en.wikipedia.org/wiki/Interleaving

937. New Version of V4 Chat (with V4 TNC) with ARQ mode updloaded.

Yahoo group: V4Protocol
Date: 2011-05-25 17:44:37 UTC
From: Rick Muething
Topic: 937 Message: 937

****** IMPORTANT MESSAGE ABOUT UPGRADING ********

All,

I have had some initial responses from the early testers that indicate at least the basics of the new release (Install, ARQ connects) are working as planned so I have uploaded the new install file for general use.

I am sure there are still some problems with this new version (many additions and changes) and there is still some tweaking and timing optimization to complete. There will probably be additional updates in the next week or so.

IMPORTANT!!! This new version and ALL following versions are NOT COMPATIBLE with the prior versions. This is due to the addition of interleaving which improves robustness in certain channels. The old version should no longer be used and will not be supported.

Download the V4Chat 0.2.0.0 zip file. Unzip to a temp directory. READ THE READ ME FIRST FILE for instructions. If done correctly this will not loose any of your settings in your existing ini file (from the previous version). You will have to uninstall the existing version and re install using the new version.

Once installed start V4Chat and open the help file. Read the suggestions on FEC and ARQ connections and a suggestion on how to initiate a ARQ “CQ” and how to Answer the “CQ”. Since ARQ uses rapid and frequent Transmit receive switching it is ESSENTIAL that you have no additional hold or delay on the PTT line for this to work. Check the trouble shooting section of the help for problems. If you are using WINMOR the same setup that works for WINMOR should work fine for V4 ARQ. If you have not used an ARQ mode before please read about the ARQ mode and look at the ARQ state diagram in the V4Chat help.

If you have problems YOU MUST enable debug logging, capture the problem session and send me the debug log (V4 TNC Debug <date>.log) and any exception logs. Please indicate the approximate time (UTC) of the problem.... (This really helps....I don’t have time to look through hundreds of K of logs). Send the log as an attachment DIRECTLY to rmuethingATcfl.rr.com and I will try and take a look at it. Posting a message saying “its broke” or “it crashed” is of no value and will not receive support (at least from me!).

At least until we flush out any bugs remaining in the ARQ mechanism PLEASE do not request feature, cosmetic or “fluff” additions or additional radio drivers. It is important to get the ARQ mode evaluated and tuned up before doing these kind of additions.

I will also post a new Development file of just the TNC with documentation. Other developers can use this (treating the V4 TNC similar to a hardware TNC) and integrate V4 into their applications. Unless you are doing development work you should not need this file or its documentation.

Good luck and have fun!

Rick Muething, KN6KB

Robert,

The same thing that would happen in any other ARQ mode (Pactor, Packet or WINMOR) is that you would have chaos since you can't reliably decode a signal if there are 10 stations transmitting at the same time. It is not possible to maintain an ARQ connection with more than two stations at the same time. There can only be one the IRS and one the ISS.

Hi Rick,
who, out of the 10 stations listening in ARQ mode, will answer and connect to the calling station?
I accidentally tuned into an ongoing qso between two A4/ARQ stations, and noticed that my station also answered and possible interfered.

Robert,
That is why you should listen for CQ's in Monitor mode as described in the suggested ARQ CQ of the help file. (it will show the calling station and CQ message). You can then switch to ARQ to answer. If you tune around while in ARQ mode your station will answer any ARQ query frame and possibly break a connection already established.

The only ways you can have multiple ARQ sessions on the same frequency that I am aware of are:
Packet where you allow a frequency to be time shared. (but even here you can't be connected to two stations at once). Shared packet frequencies are OK on VHF/UHF but don't work very well at all on HF.
or
Some form of spread spectrum modulation where you spread the signal with a pseudo random code allowing multiple stations to operate on the same frequency simultaneously. WiFi does this for example but spread spectrum is not permitted on HF.

I am open for suggestions on mechanisms (either in the V4 TNC software or by operating procedure) to allow the benefits of ARQ connections with minimal chance for interference. But such suggestions need to be thought through with a thorough understanding of the ARQ mechanism and state diagram or what would need to be modified to the state diagram.

The V4 Protocol currently does not use any unique session ID (as is used in WINMOR). This is possible but adds overhead to every V4 frame . Session ID won't eliminate interference caused by multiple stations on the same frequency but it would prevent a station that does not match the session ID from answering a data frame for example. WINMOR uses a 16 bit session ID computed from a Hash of the two connected call signs. But that requires that you make the call (connect request) to a specific call sign not a general "CQ" call. My experience with Pactor is that a CQ is issued as a non connected message (FEC frame) and the answering station then makes a connect request (ARQ) to the station sending the CQ. But if more than one viable responder tries to make a connection to the station calling CQ you have a collision and chaos as you would expect.

My suggestion for testers is to work on two independent issues:
1) Is the V4 ARQ (between 2 stations) working well, reliable and producing solid copy in most channels? Is there any mechanism where the V4 ARQ protocol gets "lost"causing a link timeout" ? (excluding signal drop out of course). If so that needs to be fixed by additional protocol logic rules or states.

2) What is a good procedure for establishing a connection using a combination of Monitor, FEC and ARQ if necessary? Does the protocol really need to have a call sign linked connection ID as in WINMOR and its associated overhead? (I don't think there will often be 10 people answering a V4 CQ unless the caller is a rare DX!)

This is why we beta test to find and solve problems!

Robert. How do you propose a CQ (to anyone) and have the responding station “reply to its own call sign”? The caller of a CQ does not know who will answer. Look at the way it is now done in Pactor or Packet...those are ARQ mechanisms and something like that (sending the CQ in FEC mode) is probably what has to be used.

Rick, as it is, it doesn't need to be a CQ call, any text in the text window, will make other stations answer..
In my opinion a CQ call should be in FEC mode.
Stations then can call each other in ARQ mode (selcal mode)

As is, if anyone leaves his station accidentally unattended in ARQ mode, on any given frequency , that qrg will be blocked.

Hi Sigi

yes, I agree with you..

cq calls in fec ... after qso starts ask the qso partner to switch to
ARQ...

Robert,
”As is, if anyone leaves his station accidentally unattended in ARQ mode, on any given frequency , that qrg will be blocked.”

That is a good observation and one that I think I can easily fix....Basically if a session times out in ARQ mode (doesn’t see any connected packets in the timeout period...now about 60 seconds) instead of returning to the ARQ state of IRSWaitLeader I can simply return to the MON mode. That would prevent an unattended station from tying up a frequency. I’ll put that on the to do list...Thanks.

Rick KN6KB

954. V4 Protocol Testing

Yahoo group: V4Protocol
Date: 2011-05-26 02:22:07 UTC
From: W6IDS
Topic: 43 Message: 954

If you are looking for a spot to check out your V4 ops,
I've got mine working alongside my BPQ32 Node Switch on
7061.000 DIAL.

Try for an ARQ connect if you like. Call W6IDS (NO SSID)
and we can check out our V4s together. I'll have it up with
my normal BPQ32 ops until about 0400Z.

If you hear WINMOR activity in process, just wait a second.
It'll pass. We'll just work the test in.

Howard W6IDS

955. ARQ mode update to V4 Protocol - TESTING

Yahoo group: V4Protocol
Date: 2011-05-26 05:31:38 UTC
From: W6IDS
Topic: 955 Message: 955

Before going any further, how's the success rate for connects
with ARQ testing.

Tried a couple of tests on 7 Mhz, 7061.000 DIAL specifically, and am getting
only partial print of transmissions while connected. NR5G tried to give me his
Cell Phone number I suspect when he sent -

NR5G: my cell p

Numerous retries, some from a cold restart of a connect attempt were a
bit awkward but suffice it to say much effort to complete a connect successfully.

Found another attempt by him to complete a connect properly but I receive only -

NR5G: w6ids de n****ARQ inactivity timeout (Score 87 S/N -1)

Some moments of silence, then he sent again -

NR5G: the static NR5G: w6ids de n

Then he ceased. . . . so I gave it a try again. . . . no connect this time.

So, will continue the tests. Not sure why I'm only getting incomplete transmissions.

From: Rick Muething
Topic: 955 Message: 956

Howard,

I would like to see the V4 TNC debug log on your sessions. It will show:
Is the failure (actually a timeout) caused by:
1) Non detection of the leader from the remote station. Leader detection does the tuning and also establishes symbol sync.
2) Failure to detect the Frame sync (3 sequential sync symbols that identify the frame type and establish the frame sync.)
3) Failure to decode the frame. (using the Viterbi decoder with interleaving)

There are internal program parameters that can be adjusted for cases 1) and 2). The ARQ should handle 3) with a reasonable number of repeats.
For reference in my testing of the interleave mechanism over many thousands of frames I was able to get a frame decode success rate of between 65-80% for all channel types at −5dB S/N. This included CCIR multipath poor and CCIR flat fading channels which were the worst.

One thing for sure that will cause a problem is excessive PTT hold time since it blocks off the first part of the leader. This applies to both ends of the ARQ session.

If possible forward me the logs (rmuethingATcfl.rr.com) with any comments about what was observed and the approximate UTC time observed.

Thanks.

Rick KN6KB

957. Sugested 30 Meter QRG for V4 ARQ Testing

Yahoo group: V4Protocol
Date: 2011-05-26 11:04:59 UTC
From: Russ Tower
Topic: 957 Message: 957

I see the testing has already started. I'm set up now and will suggest what seems to be a good QRG of 10.143 Mhz. I find it's a lot less congested on 30 meters and I think this band should in general give good continental US coverage and also stay within the MUF better than 20 meters.
I am in and out of the shack a lot but will monitor 10.143 Mhz as much as possible. I'm also open to daytime skeds on this, or on other QRG's on any of the HF bands.

73/Russ - K1DOW - Arcadia, FL

Just finished a qso with V31AE. My first qso in this mode. I agree that one is not sure who is linked to who. I think some of the timers need tweaking especially the re-transmit timers. Perhaps some of the Van Jacobsen TCP timer methods could be look at. The current timers give up too early for my liking in ARQ mode. I suggest various timers should be user setable until we get more experience with the protocol. Adaptive timers are the way to go here in my opinion.

Topic: 961 Message: 969

Hi Bernie, thanks for testing V4/ARQ with me...actually it worked but it idled out a few times cause the sig was buried in the noise floor sometimes.
I believe V4/ARQ mode should only respond if it detects its call sign (SelCal).

Calling cq in FEC mode, after establishing contact both station can switch to ARQ and continue, testing...

To use only "one key" to "send text" in the tx window I have defined the right arrow key as the "send" key , it's easier for the operator. One button only!

On my setup, the TNC waterfall blanks out some times for part of a second.

My setup is: IC-746/50 watts into a log periodic T8 beam/SignaLink USB card, Dell laptop winxp/sp2..Lots of ferrite.

Am running RMS express since beta times and I like it. Works perfect.
Actually, I like more the Winmor TNC/BPQ32/Airmail setup. It gives you a keyboard mode..

I remember the early times of pactor, we had 14073Khz defined as the calling channel and qsy after. Any qrg's on the other bands?
Every day we have openings on 28 Mhz, today s-9+ to Italy. That with the low solar flux...fantastico..

Lets do some more testing...
73 to all

I am working on a fairly simple but effective way of:
1) Issuing a connect request to a specific call sign (others not addressed won’t answer)
2) Showing which call sign you are connected to.

This update should be ready in a few days.

The procedure is pretty straight forward and similar to other ARQ modes like Pactor/AMTOR.

An ARQ connection requires:
1) TWO stations on frequency both set to ARQ mode . You can’t have an ARQ connection between more than 2 stations although others on the frequency can monitor.
2) You enter the text to send as described in the help. (Type into the keyboard text box, Then hit <Ctrl> Return to push it into the output buffer. This will force you to become the ISS and the data should start flowing to the other side. (data sent by the ISS and ACKed or NAKed by the IRS) When you are finished sending he can send his data. The switching between IRS and ISS is automatic triggered by the emptying of the outbound queue.

I am working on some refinements that I think will simplify things:
1) A Connect request frame where you target the specific call sign of the remote station. This means non addressed stations won’t answer.
2) Indicator as to who is the ISS and who is the IRS
3) Indicator as to how many bytes are left in the outbound queue
4) User set timeouts (30-180 seconds).

I hope to get this out in the next few days depending on how the testing goes. You may want to wait for this.

Excellent Rick. I think we have a winner here. V4 probably probably needs a few timers such as a re-trasnmit timer with no packet received and re-transmit timer with CRC errors on a received packet.

I'll read the V4 protocol specs but the above is based on my imperical observations with a sample size of one :-(Not sure if it is possible but a "slow start" methodology a la Van Jacobsen might be worth a look at. The idea is to send small payload packets at the beginning of a QSO and if the ACKS are coming back with no CRCs, then increase the payload or window size. Once CRC errors are experienced, immediately shrink the window size back and start again with small payload frames. Not sure if the above is possible but I believe it would certainly be worth investigating and probably work very well on HF.

Timers should be adaptive as well instead of being fixed so that several stations on the same channel do not get into 'lock step' and continually clobber each other.

From the Help file in the V4 Chat window -

If you wish to answer the CQ and "connect" to the calling station simple switch your station over to ARQ Mode and it will automatically answer a properly decoded frame with an ACK establishing the connection. Once a connection is established the ISS will send the balance of the output queue (buffer) and then send IDL frames.

Now, I'm having my own difficulty to some degree but . . . . .

The station is calling CQ. If you switch to ARQ from MON mode, the connection in ARQ between both stations is automagical. It's going to happen, all things being equal, because YOUR station/V4 sends an "ACK" or acknowledgment. YOU don't have to do anything but send text, per se, and when done just send "KKK" or "BTU" and stop typing and finish with CTRL-A.

When do you send? Look for the "KKK" or "BTU" or ??? That's for the human being Ham Operator who needs visual cues to do it right. V4, on the other hand, knows that a changeover action from one station to the other is needed when the ISS station (the one sending text) STOPS sending. . . .

Hmmmm. . . . I might not be explaining it right. My mind is on MY issue which is not seeing my own text being sent when transmitting in ARQ. That's for another message.

980. Now I know My Problem With ARQ. . .

Yahoo group: V4Protocol
Date: 2011-05-27 15:13:31 UTC
From: W6IDS
Topic: 974 Message: 980

Just finished a QSO with W4JML.

I've been having some problems up until now with sending in ARQ.

I find that I'm not sending text. I saw this because while I'm typing
and sending (or so I thought) we hit a timeout warning. HUH?

I thought I had been transmitting while ltyping additional text but
was not. I moved text to the upper window with the CTRL-ENTER
thinking it was going to transmit and continued on.

BTW, I'm saying that but after finding that I was not seeing my text
being transmitted like we do in the FEC mode. Nevertheless, in my
mind the text was probably going out but I just couldn't see it happen.

Well, after three or four timesouts while I was trying to transmit text,
I had an "AHA" moment finally. NOTHING was going out from me
and we hit the timouts. I had difficulty with other stations and now I
know why.

I see the other station sending text, but I can't see ME send text and
I now know I'm not sending out at all, regardless of my typing and
entering text. Took me long enuff to see that. . . DUH!

I'm sending Rick the Debug Log for review. Despite the issue, I LOVE
this program.

Howard,

In ARQ mode you can Only actually send (Transmit) when:
1) You have text in the outbound buffer....(you used a <Ctrl:> Return to move text from the keyboard input box to the queue (the blue italic text)
AND
2) You are the ISS. If you are the IRS and the ISS is still sending your station will wait until it receives ALL the txt from the ISS then will do the IRS to ISS transition and begins sending.

Just remember there is only 1 IRS and 1 ISS at a time and only ISS send data (IRS send ACKs/NAKs).

Of course nothing actually is counted as SENT unless the remote station correctly ACKs the frame...otherwise it just repeats until it does...or it times out.

This all works as designed. (I do test it here from one computer to another through the simulator ...MANY MANY times!)

Finn,
I have coded and am now testing a mechanism in V4 where you “connect’ to a specific call sign. This just takes one initial V4 Frame (16 bytes) where the call signs (caller and target) are sent. If you aren’t one of those call signs you don’t answer so this should work well once I get all the bugs out.

Hi Howard, I thought I had you behind me.... I only have P1 in an old KAM Enhancement board. Loved it, but borrow a PtcII for my testing towards LA3F. Love Winmor, and especially through voice repeaters in 8carrier mode. <Grin>, as you write, hi. Check my report on other forums.

I am actually getting lots of surprised positive feedback after a recent big Oslo Generic rescue rehearsal involving all volunteer and professional "agencies or organisations" after using WINMOR this "strange or wrong" way. Running WINMOR 6m FM through a Xband 6/70cm into a 70cm repeater to RMS WINMOR LA3F-7.
All this done to make Command operation center free from any desensing on 2m and 70cm frequenices.

Did not dare imposing any HF in such a close and crowded environment.

Rick has done a marvelous jobb on this cameleon mode WINMOR.
I am still not 100% sure if he really understand the enormuous potential beeing discussed here to meet our need.

And he is doing it again as a good/best? HF chat mode in V4 200Hz, to my understanding.

Have earlier done lots and lots of Amtor, and Pactor 1 and GTOR keyboarding. Even Amtor fec (2 caracter repeated), and Pactor fec, testing default 2 caracters, but also increased number of characters to 5 for robustnes, and including full 8bit character system.

GTOR was most difficult to establish an Arq link. Pactor1 a good nr 2, but became the preferred mode, due to 100% correct Arq typing.

Amtor was most easy to establish a link, (from east coast to west coast of Norway on 80m), but always too many errors in that limited arq system. (4/3)....

So.....ur PK232 may be replaced with V4 for typing whenever possible.
Keeping P1 and Winmor for file transfer purposes, hihi.

Yes sir, good to see you in print my friend.

I don't think you're going to see too much activity in this country involving such antics as actually transferring data through a TYPICAL voice repeater any time soon. That would be a nifty way to ratchet up the ire of the locals, regardless of location. That would be like using SSTV or Digi-SSTV during a SSB QSO to augment the comms or transfer a file. Definite NO-NO, something quite a few would swear to you that it is positively illegal, and nothing less than poor operation.

OHHHH, I'm pretty confident that Rick is really aware of the importance of his work and the resulting offerings. However, you'll notice that there's virtually no use of the software
outside of affiliations with WL2K or EMCOM in some fashion. U.S. Hams generally have yet to grasp the import of what's happening yet. Only a small handfull have a sense of the history being made and the potential for daily communications augmentation, EMCOM not withstanding.

You've had your finger in a number of projects; I see where you caught the attention of Dave K3GAU. I tend to agree with your thoughts about the coordinated use of V4 CHAT and PacTOR I / WINMOR. I have V4 as a "stand alone" alongside my BPQ32 system on 7061.000 DIAL to test and ultimately add it to the stable of offerings.

Because V4 ARQ doesn't flow like a CW contact it would be nice to see something likeEOT showing a carriage return (enter) has been applied

i don't know enough about it so asking for outside help.

will someone post a note on what the settings for the com ports are for xp and win7 in use with V4. i am using the TS200/FT920 with a cable to the com port. i cannot figure out what type of FLOW CONTROL to set and what to do with the RTS/DTR boxes. there are no other key lines to the rig except i can use the Signalink if i wish.

i have been able to make DX Lab/Commander talk to the rig along with Multipsk and EasyPal.

Frank, David,

I am not sure I am following your comments.
1) There is parameter in the V4 code that is called the minimum Rx to Tx delay. That is a time (measured in the CPU) that holds off a reply of a received frame until the start (PTT) of the reply. Currently set at 200 ms but it could be actually 200-250ms depending on CPU activitity. (Using the CPU, 20 ms timers and an OS that isn't true "real time" doesn't give you very fine resolution or accuracy!). Now you can compare this to for example Pactor which requires (in the spec) a Tx to Rx switchover time in the 20-30 ms range. I can set this parameter (we don't want it to be a user set parameter as it could affect compatibility) to almost anything from 40 ms to a second or more but the longer the delay the slower the throughput....that wait time is essentially dead time in the protocol....nothing happens. I picked 200 ms which is quite safe for any modern transmitter and sound card keying mechanism. (For example WINMOR uses 100 ms and few problems have been reported). If the Transmitter can't release in 200 ms there is some problem with the keying setup. In almost every case with WINMOR where someone finds a problem it is due to Delay added by the sound card keying, Transmitter VOX delay or in a few rare cases CAT command delay where the user was trying to use a serial port at 1200 baud. (that can add a couple of hundred ms). The spec and troubleshooting sections call out that those delays need to be minimum. I don't think you want to slow down the protocol because someone doesn't want to turn down the delay or VOX hold pot or insists on using a 1200 baud CAT port.

2) Sending an <EOT> with a carriage return.
a) I'm not sure of the value of this...Many people put in a Carriage return for read ability (new line). I don't think that should rigidly signal the end of text. (Maybe I want to make some "white space" in the text for read ability?)

b) In ARQ mode for V4 there is no need to do anything to tell the other guy to send....It is automatic and built into the protocol. If the current sender (the ISS) has data to send (in its buffer) it continues sending ....even if the IRS (station receiving) has entered text into his keyboard window or even into his outbound queue). When the ISS completes sending (his last queued character is ACKed) he automatically sends an IDL frame signaling the IRS he is finished. IF the IRS then has data to send it grabs the ISS position using a special handshake and state and it becomes the ISS. This works even if the hand shake is missed in either direction because the special state will keep repeating it until it is ACKed. This is well thought thorough and works and is similar in some ways to the way WINMOR does the IRS to ISS changeover. In any viable ARQ mechanism you have to have this kind of rigid and bulletproof changeover mechanism or you will have total chaos (e.g. Both stations think they are the ISS or both think they are the IRS). If that ever happens the link is essentially dead and will timeout. The only thing that could be added (I have thought about this but it is not the best operating practice) is to add a special reply (by the IRS) which says to the ISS "I don't care IF you have more data to send or not ....I want to be the ISS and send". This is sometimes called a BREAK (in Pactor). It could be done but it ends up clobbering whatever data the ISS did not finish (what do you do? ....discard it, stop in mid sentence?, restart where you were?) In general this kind of BREAK interrupt is rarely used because of these difficulties so I have not added it to V4.

At any rate that is a final polish to the protocol ...we are not anywhere near that yet!

Hope this clarifies things...

OK RICK.....I WASN'T AWARE ON THE GENEROUS TX/RX SWITCH TIME. I HAD TRIED A FEW ARQ CONNECTS, AND THEY JUST WOULD NOT WORK. TODAY I HAD ONE, SO I GUESS THAT THE USE OF THE SIGNALINK IS NOT A PROBLEM.

ASIDE FROM THAT, HOW DO I KNOW THE PROGRAM IS TALKING TO THE RIG ? SHOULD NOT THE RIG (TS2K & FT920)INDICATE THIS? WHEN I RUN MMSSTV AND DX LAB COMMANDER I SEE A "CAT" OR "PC" FLASH ON THE RIG DISPLAYS.

Readability is my question. The intermingling of the received and transmitted at best makes for confusion. Currently You are receiving replies that may be the answer from 2 tranmissions back . A single TX/RX field at best is confusing. Maybe no need for a EOT but possible a seperate TX buffer window from the Received window would solve the confusion

Currently it is like holding 2 or more CW contacts at the same time. this will not become the viable mode people want untill this confusion is gone.

John,

The waterfall looks the same for both ARQ and FEC....the data transmitted uses the same format and modulation. You can run a FEC loop back test to watch your own transmitted signal...read the help and it explains the simple procedure.

From: Rick Muething
Topic: 999 Message: 1008

If you are using the CAT commands for keying (It works on the TS480 but I'm not sure if that works on the TS2K) its pretty obvious that the radio keys (PTT) or changes frequency. If you use VOX the audio (from the sound card interface) will key the rig. When you are using VOX (determined from the V4 setup) it adds approx 120 ms additional PTT time to accommodate for the typical VOX delay. All this works and is actually a little "looser" than WINMOR in terms of timing. There are 3 or 4 places in the Help where it says to keep the VOX delay/hold at minimum (DLY fully CCW on the SignaLink). I think too many don 't bother reading and would rather just ask questions.... nothing new there!

For an ARQ connect remember there is a chain of events that MUST happen to establish and maintain the connection:
1) Both on the same frequency and sideband. Frequency error must be within the tuning range setting (default +/- 100 Hz)
2) Both on ARQ mode and listening.
3) Decent propagation ...I would say –5 dB S/N (3 KHz Noise bandwidth) is about the practical minimum ....I get about a 60-80% frame decode rate with that depending on the channel type. For short times it will tolerate worse.
4) ABSOLUTELY no added hang to the PTT....There is no way around that....If your PTT is still active 200 ms after the audio stops you'll never hear the ACK/NAK from the other end. The timing numbers I explained are generous...and could easily be cut in half without a problem as long as users remember to use minimal VOX delay/hold.
5) Correct levels (green signal on the receive indicator) no more than about 60% Rated PEP on transmit. NO RF feedback.

Screw up any one of those 5 things and you don't have a link (this has nothing to do with V4 ...every ARQ mode is like this).

I am still testing locally some nice new features that make calling CQ and a specific target call sign very easy. But it involved some extensive surgery so that usually means I broke some things that used to work! Hopefully in a day or 3!

Frank,

That is one reason there are colored text fonts used in the main window. That should make things pretty obvious:
Italic blue text YOU Sent
Green FEC text received
Red strikethough received FEC with uncorrectable errors
RED BOLD Alerts
Purple ARQ status messages
Black BOLD Corrected ARQ received text

In any given setup (ARQ, FEC etc) you won't have all those. Having a different window for each function is not very practical and you then loose any time/sequence information. We have used color coded text within a single text box in many client programs with good success and user acceptance.

My goal now is to get the details of the V4 protocol debugged and working solidly. I don't want to get bogged down now in details of what is the best color/font/display mechanism for the user interface. The V4 chat is just the display program and can be easily altered. It probably represents about 20% of the V4TNC code and effort. The idea of having a separate Virtual TNC (the V4 TNC.exe program) is that other developers can easily incorporate V4 into their own client design and GUI. They just treat the V4 TNC as they would a hardware TNC. (WINMOR and the WINMOR TNC work the same way and there are now about 4 or 5 programs using the WINMOR TNC...all from different developers.) Implementing a client GUI is a skill that a lot of programmers have experience with....the DSP and protocol code is a lot more specialized.

One thing you learn when working on these complex DSP programs. Good software like fine wine takes time! Now where is that glass of wine?

Rick, et al:

One timing issue that should be considered I recall from the days with AMTOR and PACTOR. I'm not sure how relevant this is but these two modes had an idle time of .17 second. According to what I recall of the spec, this meant that QSOs were limited to 20000 km. Not being a DXer this wasn't a limitation for me, but perhaps something to be kept in mind before we settle on timing parameters.

1013. Still having a problem with ARQ

Yahoo group: V4Protocol
Date: 2011-05-29 11:42:14 UTC
From: kirkharding@rocketmail.com
Topic: 1013 Message: 1013

Rick,

Yesterday afternoon, I sent an email to you directly versus posting it on the refletor. I did this due to the fact that you can't add enclosures to reflector postings and I thought you might see it sooner. I attached a copy of my most recent V4 log. I have gone ahead and posted this to the V4 reflector files section. I understand that there is a chain of eents that must be met in order to establish an ARQ connection. As stated in my personal email to you, I have no problems using FEC but just as soon as I switch to ARQ I am unable to receive. When in ARQ, I do get a connect and (I think), text is transmitted (I can't see it), but other than receiving the other call sign (i.e. WB0ZYU DE K6KAR), I see no further text until I switch back to FEC. The problem is obviously on my end but I'm unable to figure out the fix. Bottom line is I've had no success with ARQ.

73,

Kirk, K6KAR

1015. Re: arq timing

Yahoo group: V4Protocol
Date: 2011-05-29 12:35:31 UTC
From: la7um
Topic: 999 Message: 1015

Pete and Rick. Yes. Amtor was very rigid. Pactor1 had the option for "long path" connection entering the exclamation symbol ! just ahead of the Callsign.

This worked in two ways:
Either as intended for a longer real path
or
using very old slow switching rigs on pretty local qsos (fringe benefit?.

I don't here exactly remember the added delay....some 1.3 sec or something.

I am dealing with the same issue at the time beeing in another way using WINMOR with its strong FEC running through one voice repeater, or even one client through and added xband repeater.
(See the WINMOR and winlinkemcomm forums)

This needed a lot of tweeking finding working parameters, but once that has been done, it works.

Once the research or tweeking (taking a lot of time) has been done, this is a matter of standardization. A very important one.

In a local VHF environment it is easy for all involved parties to agree upon their "local standard".

If infrastructure is down, either direct if possible, or via ANY surviving repeater a message could be transferred from an office with a simple magnet foot antenna in the window to another part of the town where the receipient is located the same way, OR it could be a place where HF antennas have been erected and the message might be forwarded on HF anywhere into the winlink system.

(Kind of internal packet, but without the need for extra packet infrastructure). Some voice repeater would probably always be the very first priority of establishing.

It is a lot of internal timers/timeouts within the protocoll itself so this I guess is not easy programming.

My posting here is not solely V4, sorry for beeing partly off topic, but the thinking beeing discussed on this thread is important.
It is always a tradeoff between throughput and delay parameters, and I think Rick here in V4 has found a good "middle road", operation the OS WINDOWS and soundcards.

On HF (or a symmetrical VHF/UHF setup) both parties do need using the same parameters.

I believe that the Pactor1 ! exclamation mark ahead of the called callsign did inform, during the intitial negotiation with the far distant station, that the remote Pactor station as well should automatically be entered in the Long path mode as well using the same delay parameter.

Thus ensuring that both parties still will run identical switching parameters, off course at the cost of througput.
But the alternative might be NO througput.

Maybe something like this might be an idea for implementing, letting V4 work around the world? Or enabling old vintage rigs to be used?

From: Rick Muething
Topic: 999 Message: 1017

The long path in Pactor was there to handle the propagation path time which was significant compared to the normal Pactor reply time. A signal can go around the world (25000 mi) in less than 140 ms so with the timing used in V4 (or WINMOR) propagation timing is not a concern so there is no need for “long path” or timing tweaks by users. If the users Transceiver switches in 100 ms or less (most are about 5-10x that fast) and the user does not hold the PTT down after the audio is stopped there is no problem and no need for adjustments. The basics here are that ARQ requires reasonably rapid T>R and R>T switching and that doesn’t permit adding hundreds of ms of hold time to the PTT unless one is willing to require users to make specific adjustments (like circa 1980’s packet with all its timing parameters). That would just insure confusion, and degrade throughput.

Kirk,

It is working...It’s the same software others are using.

Rather than spend half a day digging through your logs it will be more productive for me to finish testing the new release (which has provisions for calling a specific call sign or calling CQ in ARQ mode). This will be easier to user and understand.

Subject: [V4Protocol] Still having a problem with ARQ

Rick,

Yesterday afternoon, I sent an email to you directly versus posting it on the refletor. I did this due to the fact that you can't add enclosures to reflector postings and I thought you might see it sooner. I attached a copy of my most recent V4 log. I have gone ahead and posted this to the V4 reflector files section. I understand that there is a chain of eents that must be met in order to establish an ARQ connection. As stated in my personal email to you, I have no problems using FEC but just as soon as I switch to ARQ I am unable to receive. When in ARQ, I do get a connect and (I think), text is transmitted (I can't see it), but other than receiving the other call sign (i.e. WB0ZYU DE K6KAR), I see no further text until I switch back to FEC. The problem is obviously on my end but I'm unable to figure out the fix. Bottom line is I've had no success with ARQ.

73,

Kirk, K6KAR

Kirk, Good Morning. . . .

You are experiencing the same type of conditions as I am or so it seems. I find the ARQ mode not useable at the present time for ME. There are others who are using ARQ just fine.

The symptoms you described are pretty much in line with my own so to say that "the problem is obviously on my end but I'm unable to figure out the fix" is not an acceptance of guilt. You're not a programmer, so far as I know and neither am I. You can only provide the input to the developer as best you can, regardless of what others are experiencing, and then see where it goes from there.

That's what Alpha and Beta testing is all about. Finding anomalies and reporting them.

Good Moring to you Howard,

It is a little frustrating but I suspect it may be a timing issue. I know that Rick will soon release an update so will just wait until I can give that a try. It's strange that I can use FEC and it works great but when I switch to ARQ, no joy. I'm using a Flex-5000 with virtual cables and virtual com ports. These along with V4 are installed on a home brewed I7 computer running Win7 Ultimate X86 . I've had no problems with other ARQ modes (ALE-400 and 131). It's interesting that we both can connect using ARQ but don't see any data transfer (text). As you point out it's beta testing so will continue to see if any changes I make correct the problem.

Well, sure, it's strange. Some of V4 Chat is "strange", for want of a better word, for someone with Pactor baggage <GRIN> It is similar but not the same. I use Pactor I for years and V4 takes a little getting used to but, refinements not withstanding, that's not to say V4 is totally wanting. It's current mental issues of this ol' Pactor lover that have to be overcome.

I'm using the VISTA 64 OS myself and THAT took some gettng used to for sure - but it's doing quite well with ME. . .HERE. . .now.

In my initial ARQ attempts, I displayed the other person at first, then i stopped . . .although we were still transmitting. My own transmit attempts were made with no visible sign of the transmitted text - the text I moved upwards was not followed by the displayed outgoing text. Near as I can tell, I wasn't transmitting text - the other station saw none - and we simply sat there for all intent and purposes for the timeout to occur. Most likely, it well may be my incorrect use of the program when transmitting.... and that may be where a refinement comes in. FEC was always successful as you found out.

Yep, we'll see what the next release has to offer. With that in mind, when we test it and come across an "issue" we let Rick know in the forum usually. IF. . .Rick decides to investigate it immediately, he'll ask you for just the Debug log and have you send it to him direct. He also might have some additional instructions for you to follow in line with the log submission.

1032. Latest Update of V4 Chat (0.2.1.0) on Yahoo FTP site

Yahoo group: V4Protocol
Date: 2011-05-30 11:42:56 UTC
From: kn6kb
Topic: 1032 Message: 1032

All,

This is an important update with significant changes on how to call "CQ" or call a specific call sign in ARQ mode. There may be some incompatibilities with version 0.2.0.0. Download (from the V4Protocol reflector) the file V4Chat Setup (0.2.1.0). Unzip and save the files in a temp directory. Read the ReadMeFirst file. Uninstall your existing V4Chat if already installed (your setting will NOT be lost). Install the new version with the msi file in the zip.

After starting V4Chat be sure and read the help especially the section on Typical ARQ operation ...several changes there.

I think this is much simpler and more straightforward in terms of operating practice. Let me know your feedback.

73, and be sure to remember our Veterans this day!

Rick,

I just installed and took a quick glance at the Help info for ARQ comms.

I'm liking what I'm seeing in the information thus far. Have to do chores,
but will be anxious to test in an hour or so. Right now, it's monitoring
on 7061.00 with my RMS WINMOR and PacTOR I messaging.

1038. Auto-update? - RE: [V4Protocol] New Version 0.2.1.1

Yahoo group: V4Protocol
Date: 2011-05-30 14:30:05 UTC
From: Daniel V. Wolff, Jr.
Topic: 1035 Message: 1038

Will the V4-Chat program auto-update or do I need to uninstall the previous version and install the new one? If it doesn't auto-update, will you be including this feature in future version? I very much prefer the auto-update method.

Subject: [V4Protocol] New Version 0.2.1.1

OK this version fixed that bug in 0.2.1.0. It should work fairly well except for a tricky known bug in a timeout abort when CWID is NOT checked...So you can avoid this by simply leaving CWID checked (default) in the setup.

There are probalby still issues with this. If you have a problem PLEASE document it well (debug logs etc) and send the logs with a description of the problem directly to me (not through the reflector) at rmuethingATcfl.rr.com and I will take a look.

Be sure and read the help to find out how to send CQ and how to call a specific station!

73,

Good testing.

It currently does not enable auto update....In the beginning where there are lots of changes that is not very practical as new full installs are best. Once things settle down with less often releases I will enable the auto update.

I've had some activity on 7061.000 where I have my RMS Winmor and
PacTOR I set up for Gateway. I'm also running BPQ32 Node Switch.
If you can deal with the periodic WINMOR connects for traffic and a
PacTOR I station checking the mailbox, feel free but on a first come,
first serve activity, of course.

I'm testing V4 too, so the arrangement works well as long as we play
nice <GRIN>

1049. Loop test gives only some correct words back

Yahoo group: V4Protocol
Date: 2011-05-30 16:53:09 UTC
From: schwartzj22
Topic: 1049 Message: 1049

To all,

I have been using V4Chat (version 0.2.0.0) now for about 3 days. I think it is all working properly but I have yet to make a contact. I do have a question just to see if it is all working properly.

Test results:
1) Two tone test works and I used it to adjust the drive output.
2) feed-back loop test gives only partially the correct words back and sometimes yields no words back.
3) I have correctly copied some stations but did not connect with them in FEC mode.

My station is as follows:
Windows XP, Icom 746Pro, Interface is the US Interface Navigator (has its own sound card)
I have been using this configuration for years with the digital modes and all is working properly.

What is the significance that the loop test gives only partially the correct words back? Is it critical that all the words need to come back in order for the FEC mode to work properly?

Tks,
Joel-N3GSE

V4Protocol@yahoogroups.com
Subject: [V4Protocol] New Version
0.2.1.1

OK this
version fixed that bug in 0.2.1.0. It should work fairly well except for a
tricky known bug in a timeout abort when CWID is NOT checked...So you can avoid
this by simply leaving CWID checked (default) in the setup.

There are
probalby still issues with this. If you have a problem PLEASE document it well
(debug logs etc) and send the logs with a description of the problem directly to
me (not through the reflector) at rmuethingATcfl.rr.com and I will take a
look.

Be sure and read the help to find out how to send CQ and how to
call a specific station!

73,

Good testing.

Hello group, have any frequencies/bands been agreed to. It seems there are stations QRV all over the place. If we are to experiment with this mode I think it is necessary to have established frequencies , at least to get started.

I've experienced the same problem with version 0.2.0.0 -- restarting the program seems to fix the problem. I believe this is a software issue of some sort.

I am running Windows XP and .NET with all the latest patches. The radio is an ICOM 746Pro. I am keying the radio with PTT only via a home brew opto-isolated interace.

All,

This is an important update with significant changes on how to call "CQ" or call a specific call sign in ARQ mode. There may be some incompatibilities with version 0.2.0.0. Download (from the V4Protocol reflector) the file V4Chat Setup (0.2.1.0). Unzip and save the files in a temp directory. Read the ReadMeFirst file. Uninstall your existing V4Chat if already installed (your setting will NOT be lost). Install the new version with the msi file in the zip.

After starting V4Chat be sure and read the help especially the section on Typical ARQ operation ...several changes there.

I think this is much simpler and more straightforward in terms of operating practice. Let me know your feedback.

The loopback test requires that you connect audio out of the sound card directly to audio in (see help) and set the appropriate drive levels. It has nothing to do with the radio or PTT keying although it might work with some radios with a monitor feature (allowing you to monitor what you are sending). Normally if you have the levels set approximately right (in the green) you'll get very near 100% FEC copy.

Rick,
The good news now is that I just had my first contact. All was perfect.
Since I do get some of the words correct it must mean that connect audio out of the sound card is connected directly to audio in or else I would get no words correctly, correct?
For the drive level, I used the minimum level in the two tone test to just get a perfectly stabile power out (approximaley 50-60 watts with my 100 watt rig) reading on my watt meter.

I guess even though the loop test is not 100%, I am able to have a qso with no problem.

Thanks for your help and thanks for a great new digi mode,

From: Rick Muething
Topic: 1049 Message: 1063

Joe,

The loop back has to do with signals. You are sending audio from the sound card output...you are receiving DIFFERENT audio on the sound card input. On FEC you can do this full duplex (not on ARQ). BUT you have to actually connect the two signals together...they normally are not connected. You may be able to make some copy copy (which sounds like what you have) it if you have some leakage (through the sound card interfaced or ???) but you probably won't get 100% copy. Basically the loopback test is a simple mechanism to test that your sound cards are working correctly. the normal sound card interfaced does NOT loop back the transmit audio to the receive audio. There isn't much we do as hams that is really full duplex. It is there just because it was easy to do because the sound card playback and capture are really two independent functions and can be run simultaneously.

1065. Re: Loop test gives only some correct words back

Yahoo group: V4Protocol
Date: 2011-05-30 18:24:43 UTC
From: schwartzj22
Topic: 1049 Message: 1065

Rick-OK, I think I got it.
Given my station configuration, is there an easy way to connect the two signals together?
One point here is that this loop test reads as if it should work if a station is operating normally with the other digi modes. So this is not so. Others probably get stuck on this issue also.
Tks,
Joel-N3GSE

--- In V4Protocol@yahoogroups.com, "Rick Muething" <rmuething@...> wrote:
>
> Joe,
>
> The loop back has to do with signals. You are sending audio from the sound card output...you are receiving DIFFERENT audio on the sound card input. On FEC you can do this full duplex (not on ARQ). BUT you have to actually connect the two signals together...they normally are not connected. You may be able to make some copy copy (which sounds like what you have) it if you have some leakage (through the sound card interfaced or ???) but you probably wonâ☐☐t get 100% copy. Basically the loopback test is a simple mechanism to test that your sound cards are working correctly. the normal sound card interfaced does NOT loop back the transmit audio to the receive audio. There isnâ☐☐t much we do as hams that is really full duplex. It is there just because it was easy to do because the sound card playback and capture are really two independent functions and can be run simultaneously.

It has nothing to do with the radio or PTT keying although it might work with some radios with a monitor feature (allowing you to monitor what you are sending). Normally if you have the levels set approximately right (in the green) youÃ¢Â□Â□ll get very near 100% FEC copy.

From: Matt Zilmer
Topic: 1035 Message: 1066

The last resort is to edit the registry. However, unless you know what you're doing it can be dangerous. There are several freeware registry editors that make the job easier, and of course there is Windows' own RegEdt32.

You can read up on this via web pages. I don't try to give advice about specific installations when it comes to registry editing.

1067. FEC works great

Yahoo group: V4Protocol
Date: 2011-05-30 20:48:33 UTC
From: kirkharding@rocketmail.com
Topic: 1067 Message: 1067

I've repeatedly tried to use ARQ but have not been able to transfer text. I've established connectivity with no problem and have good S/N both ways. If it was one instance of this problem happening then I'd say the problem is mine and it may be anyway. But the other connections have indicated the same thing. Not sure what's causing the problem. FEC works perfect and I've run the loop back without fault. My setup is: Flex-5000 using virtural cables for audio transfer. Computer is is homebrewed I7 and OS is Win7. I'm able to run other programs i.e.FLDIGI, MultiPSK (ALE-400 in ARQ). Also have sucessfully run (not recently), Winmor. Any ideas?

Thanks,

Kirk, K6KAR

Kirk,
Almost certainly the problem is related to the Flex. We have used WINMOR successfully (in ARQ mode) with a flex but it requires careful Flex setup to minimize the latency. The flex can add considerable latency to the audio which adds up to a problem in some ARQ modes. I don’t know the timing of ALE-400 ARQ. The other problem could be any hang or hold of the PTT blocking off the reception of initial leader. If it works on FEC the same exact data mode and modulation is used for ARQ...The only difference is the frame ID code and the ARQ protocol. If you have setup WINMOR on the Flex the same setup should work for V4. The WINMOR help file has the details for the flex setup. If you don’t have a WINMOR setup I can probably send you the help file for WINMOR and that may help you with the setup. The latency that the flex can add can be a problem especially on fast ARQ turn around modes like Pactor 2, 3, or 4.

I've not had the opportunity to aggessively test the latest iteration, but turnaround time seems OK to me. I'll have more time this week and will wring it out. The current Flex Release Candidate has tightened-up some internal processes and latency is reduced, so V4 and Flex should be OK as a client system. If Kirk needs more info he can reach me : n4tabATearthlink.netIf Kirk needs more info he can reach me : n4tabATearthlink.net

Thank you Rick for all of your passionate and good work. This program has a very big potential for EMCOMM.

Lynn,

Simply connect the output of the SignaLink to its input just as you would on any other sound card. Set the levels appropriately. This is described in the help file.

Topic: 1077 Message: 1077

Rick, All

V31AE reporting..

ARQ mode

Station A calls station B (target call)
both station connect

A sends some data successfully to B

A executes "abort"

A and B stop transmitting

B sends "idle out" after a fix/set time, indicator on the TNC says "disconnected"

A indicates on the TNC "connected to B" (no reset to "disconnect")

Robert

Rick, All

V31AE reporting..

ARQ mode

Station A calls station B (target call)
both station connect

A sends some data successfully to B

A executes "abort"

A and B stop transmitting

B sends "idle out" after a fix/set time, indicator on the TNC says "disconnected"

A indicates on the TNC "connected to B" (no reset to "disconnect")

1084. RE: [V4Protocol] FEC works great

Yahoo group: V4Protocol
Date: 2011-06-01 23:33:18 UTC
From: K6KAR
Topic: 1067 Message: 1084

Rick,

I changed the settings within Power SDR software to those shown in the WINMOR setup files. Actually those setting aren't much different than what I already had. Also made some minor changes in the VAC settings. Today was the first time I've had the opportunity to run a test. Made a contact with Bob, W0FYI and I was able to send data (ARQ) which he saw. However, he told me that although he had data in the buffer to send, it never did send. It also seemed to me that it took a long time for the my data transmission to trigger transmit. At this point I'm not sure what needs to change. I did reinstall WINMOR and sent myself a test email message through a node. It worked fine. Very perplexing.

Kirk, K6KAR

From: V4Protocol@yahoogroups.com [mailto:V4Protocol@yahoogroups.com] On Behalf Of Rick Muething
Sent: Monday, May 30, 2011 4:04 PM
To: V4Protocol@yahoogroups.com
Subject: Re: [V4Protocol] FEC works great

Kirk,

Almost certainly the problem is related to the Flex. We have used WINMOR successfully (in ARQ mode) with a flex but it requires careful Flex setup to minimize the latency. The flex can add considerable latency to the audio which adds up to a problem in some ARQ modes. I don't know the timing of ALE-400 ARQ. The other problem could be any hang or hold of the PTT blocking off the reception of initial leader. If it works on FEC the same exact data mode and modulation is used for ARQ...The only difference is the frame ID code and the ARQ protocol. If you have setup WINMOR on the Flex the same setup should work for V4. The WINMOR help file has the details for the flex setup. If you don't have a WINMOR setup I can probably send you the help file for WINMOR and that may help you with the setup. The latency that the flex can add can be a problem especially on fast ARQ turn around modes like Pactor 2, 3, or 4.

1089. The 30m Band Utilization Chart -- 2 June 2011

Yahoo group: V4Protocol
Date: 2011-06-02 08:21:23 UTC
From: Ian Wade G3NRW
Topic: 1089 Message: 1089

Just in time for the 30m Multi Mode weekend -- 4/5 June 2011.

A few weeks ago Don Hobson, KB9UMT, founder of the 30m Digital Group, published the updated "unofficial 30m bandplan" on the 30MDG reflector. I responded, saying that the listing was a little misleading, because some frequencies were dial frequencies, others were emitted frequencies, and it wasn't clear which was which.

Don challenged me to do better. At first I tried to improve the listing format, to draw the distinction between dial and emitted frequencies, but quickly realized this was not an easy task! I finally capitulated and decided on a graphical format instead:

http://homepage.ntlworld.com/wadei/30m_band_utilization.htm

I have called it a "Band Utilization" chart. It is exactly that. It is not a "bandplan", nor even an "unofficial bandplan". Rather, it is an attempt to graphically portray the many modes that are actually in use on 30m today. On the chart there is a clear distinction between dial frequencies and emitted frequencies, helping you to accurately set the correct frequency and to identify signals as they appear on the waterfall.

Prior to posting the chart on my website, I sent a couple of draft versions to a number of the world's "movers and shakers" in digital communication and HF. Several of them responded with very helpful comments, suggestions and corrections, for which I am very grateful.

It's been an "interesting" exercise to fit everything in, but I hope you will find the finished chart useful. I think you will be intrigued to see just how much is squeezed into the band, especially above 10.140. In particular, the graphical approach highlights several overlaps between modes, which (to me at least) weren't at all obvious from the tabular frequency listing. I was also unaware of just how many Winlink RMS stations are active: no less than 48 stations on 32 frequencies, mostly above 10.140.

The chart is a living document. If you see any errors or omissions, or want to suggest improvements, please email me at g3nrw@...

Enjoy the Multi Mode weekend!

From: Rick Muething
Topic: 1085 Message: 1092

The only time the transmit signal can be seen on the waterfall is during the FEC loopback test. That special test runs both the playback and capture devices at the same time since FEC Full duplex is selected. ARQ mode only operates half duplex.

1093. Re: [V4Protocol] FEC works great

Yahoo group: V4Protocol
Date: 2011-06-02 11:08:31 UTC
From: Rick Muething
Topic: 1067 Message: 1093

Kirk,

It sounds like may not understand the operation of the ARQ and when and how data is transferred. Read the help on ARQ operation. You can only send when you are the ISS but you can still queue outbound data while you are the IRS.

While we are still debugging the software in early beta testing casual descriptions don't help much....In software the devil is in the details.
If you see something strange here is the way to help improve the problem:
1) Be sure you have debug logging enabled ...without that there is little data captured for debugging.
2) Describe the problem in words. Note the approximate time (UTC) the problem was observed. I don't have the time to wade through hundreds of K of debug logs.
3) Describe your setup (Radio, Sound card/interface, OS, CPU Type, RAM, Keying Setup)
4) Send me the file V4 TNC Debug <date>.log as an attachment. Send directly to rmuethingATcfl.rr.com not posted through the reflector.

With the above I can do something. With generalized comments it is very difficult.

73,

Rick KN6KB

From: la7um
Topic: 1089 Message: 1104

Ian, this reality of crowdness is part of what I love about the 200hz V4 concept. AND why I whish RMS Express ability,like Airmail limiting
a session to 500hz.

I have learned it is some protocoll difficulties in WINMNOR, but on Pactor 1,2<=>3 it is already in the SCS protocol, so that might be an easier task.

My thought is that when not REAL emcomm, then it is more polite for a ham staying within 500hz only.

It is not good behaviour using more BW than necessary for the task, especially whithin IARU recommended narrow segments, but could be used wide during a REAL emcomm event.

As it also is not good behaviour blocking a small wide band segment with a slow 500hz mode.

Apart from that there is a LAW issue on 30m in some countries as well.
Norway is one (max 1000hz on 30m), and I belive that Canada has limitations as well, maybe others?

Thanks very much for your good work.

1106. The 30m Band Utilization Chart -- 6 June 2011 update

Yahoo group: V4Protocol
Date: 2011-06-06 06:20:15 UTC
From: Ian Wade G3NRW
Topic: 1106 Message: 1106

Since posting the first public version of the 30m Band Utilization
Chart, I have received many emails, several of which provided yet more
input for the chart. The updated version is now available at:

http://homepage.ntlworld.com/wadei/30m_band_utilization.htm

Summarising the additions and changes:
~~~~~~
* Added CW SOTA at 10.118
* Added beacon at 10.125
* Added QRSS at 10.139 dial, and narrowed QRSS to 10.1400-10.1401
* Added Olivia at 10.1385 dial
* Changed Olivia500 to Olivia125/250/500 throughout
* Removed SkipNet at 10.141 dial
* Added IARU Region I beacon DK0WCY at 10.144
* Added Olivia to the multi-mode box at 10.142-10.145
* Added NET30 at 10.145 dial
* Added SkipNet at 10.14669 dial
* Added SSB VK 10.140-10.150
* Added legend indicating dial frequencies are USB unless otherwise
stated
~~~~~~

It seems that 10.140-10.150 is busier than ever!

Thanks again to everyone who emailed.

1110. IMPORTANT UPDATE V4Chat 0.3.0.0

Yahoo group: V4Protocol
Date: 2011-06-06 14:41:33 UTC
From: kn6kb
Topic: 1110 Message: 1110

All,

I have been working on several enhancements (features, fixes, documentation, and robustness improvements). This new release is 0.3.0.0 and is posted in the files section. The help has had significant enhancements incuding information for use with Flex radios.

Unfortunately one of the important robustness improvements to the Frame sync coding is NOT compatible with prior 0.1.x.x or 0.2.x.x. versions. This will require an uninstall of those versions and a new install of version 0.3.0.0. None of your existing settings will be lost in this process if you follow the ReadMeFirst file contained in the 0.3.0.0 Full install.zip.

My testing has shown these changes provide an improved robustness and I don't beleive any further significant changes will be required to the protocol causing incompatibilities. I expect to enable auto udpateing on the next release after 0.3.0.0.

Good luck. Thanks again for all your feedback. If you find a problem or don't understand something in the help let me know...that is how we have made such good progress.

73,

Rick Muething, KN6KB

1116. V4 Version 3

Yahoo group: V4Protocol
Date: 2011-06-06 18:28:46 UTC
From: rapidan2011
Topic: 1116 Message: 1116

Got it working...I think!

I need some clarification on the ARQ mode. When I attempt to send a note to a connected station why does it keep sending the same not several times for 30 sec?

I see this happens when calling CQ which I presume is correct.

Did I miss a setting or set something incorrectly?

Ted, WB2LOU

From: Rick Muething
Topic: 1116 Message: 1117

CQ is really just a specially formatted data frame. It is just meant to tell others you are available and what your call signs is....Just like a voice or CW CQ.

You make an ARQ connection when someone calls you and you ACK their connect request....once that happens you are “connected”. Now data sent (from the ISS ...the station initiating the connection) will flow when:
1) There is data in the outbound queue (not just in the keyboard text window).
2) There is propagation to the other station (the IRS)
3) The IRS Acknowledges a successful decode with an ACK
4) That ACK is received by the ISS allowing it to advance to the next frame of data.

If you don’t have 2 AND 3 AND 4 then the ISS repeats the data until you get 2) 3) and 4) or you timeout (depends on your timeout setting in the setup (default = 90 sec). This is pretty much the way virtually all ARQ mechanisms work.

There is no operational difference in Version 0.3.0.0 and versions 0.2.x.x. except the change in the coding for the frame type and that makes the two versions incompatible as I said.

0.3.0.0 down loaded fine on my Laptop using VISTA. No lock ups so far during some testing.

I have one issue I'm curious about and was noticeable in past revisions.... The Two Tone test is a great tool for setting the average
output. I'm using a Bird 43 Watt Meter and set the two tone level to exactly 50 Watts using the Icom USB Audio level control. (IC-7200) When I transmit
from the text window, I average about 79 or 80 Watts. I think the reason is because of the multi tone V4 average
over only 2 tones. Does this look about right?

Thanks;
Chuck, WA7BRL

From: Rick Muething
Topic: 1118 Message: 1123

Ed,

The V4 waveform ONLY sends two tones at the same time during the leader which is the same as the two tone wave form. This waveform will show a typical (on an AVERAGE reading wattmeter) value of about 70 Watts at 100 wats PEP.

The rest of the waveform for V4 is pure FSK sending only one tone at a time with no phase discontinuity. Depending on the peak to average reading capability of the meter it will show different values but the peak value AND average of the FSK waveform is 84% of the peak value of the two tone waveform. The reason for this is just to minimize transmitter heating of the high duty cycle wave during long periods as the ISS sending data.

In all cases the important fact is that the level for the two tone test to NOT generate significant ALC since that would cause distortion and splatter of the signal. If the two tone test does not generate ALC the data waveform should not either since it is 84% of the peak value.

I am really missing something, so I'll ask my dumb question. How do you ACK the connect request? I ask for 2 reasons...First when a station calls there seems to be a auto connection made and from that point nothing I want to send via <Ctrl>Enter seems to xmit. Second if Itry using the ARQ Call dialog box with the stations call a red message shows stating :Not while connected." I have dug throught the help files and find no logical answer.

Ted,

Read the help files on establishing an ARQ conneciton. Here is the summary.

1) If you want to call CQ follow the process described. ARQ Call on the Calling menu click Send CQ. This sends a 30 second connect request to call sign CQ (that is not a legitimate call sign so no one will auto answer.)

2) If someone hears your CQ and wants to call you. (Or you want to answer someone else's) you use the Call call sign with their specific call.

3) In the TNC form it shows if you are connected or not and to which station. It also shows whether you are the IRS (receiving station) or the ISS (sending station)

4) To enter data type it into the keyboard text box. Hit <Ctrl> Return to move entered text to the outbound queue. If you are the ISS it will start sending data waiting after each frame for the (AUTOMATIC) ACK from the other side. You NEVER have to manually "Send an ACK or NAK" that is the job of the protocol and its described in nauseating detail in the state diagrams and protocol spec. The V4 TNC implements the protocol just like a hardware TNC implements the Pactor or Packet protocol.

If you are the IRS you won't be able to send until the other side has finished and sends an IDL frame (again totally automatic).

Think of this being the way two people would Talk (hence the name V4 "Chat") He sends ....you listen...when he is done sending, you send he listens. The protocol protects against having two senders or two listeners....Always one is ISS and one is IRS and those rolls are exchanged whenever the senders buffer goes empty (all the data has been sent and ACKed) and the other side (the IRS) as something to send (data in the output queue.) Its all automatic and once a connection is made it requires ONLY typing data into the keyboard box and typing <Ctrl> Enter to move it to the output queue. That mechanism was developed in the early versions to allow you to edit text in the text box BEFORE committing it to transmission.

Read though the help on the ARQ operation and look at the state diagrams. Also look at the V4 TNC form...it shows in big letters who is the IRS and the ISS and which station you are connected to. If you are connected it won't let you send out a connect request ("Not while connected") ...only ONE connection to ONE station at a time in ARQ mode (anything else would be total chaos!).

Please read the help! This is all described in there. This allows you to monitor ARQ or FEC data while being in the ARQ mode (disconnected) . If you can’t decode the signal and get garbled text (red strikethrough) it is because there is either no signal or it is too weak or off frequency. Once connected to a specific call sign you will get ONLY bold BLack text (always error free) in the receive window. If you want to clear the old ([pre connected) text simply right click on the window.

The idea is to allow you to operate from the keyboard (This IS a keyboard mode) without having to go back and change from Monitor or FEC to ARQ There is no differenced in the data in either ARQ or FEC...just the protocol.

Yahoo group: V4Protocol
Date: 2011-06-07 00:43:20 UTC
From: Rick Muething
Topic: 1128 Message: 1132

The only way that can happen is:
1) Someone enters their call sign as “CQ”. Actually this CAN’T happen....there is a filter on the call sign setup to INSURE it is a legitimate Amateur or MARS call sign.

2) (This is what likely happened) Someone is calling CQ Another QSO on the Same or nearby frequency is on going (and an ACK from that QSO is interpreted by the station calling CQ as an ACK). I can probably build protection in the protocol for that so a call to CQ can never recognize an ACK and therefore will ALWAYS time out.

But this brings up an issue I observed today...One frquency several people calling CQ, calling stations or trying to work a connection ALL at the same time ALL on the same frequency...Hey guys this is a 200 Hz narrow band mode not spread spectrum! You can’t have two QSOs on the same frequency at the same time. (same for Pactor, Amtor, WINMOR etc...Packet can time share a frequency at the expense of throughput).

Rick. Hope some of your frame sync ideas may benefit WINMOR later.
Some of the most difficult part of a WM link is decoding the first response. Once linked, it always works. Cause of the starting trouble is usually due to noisy background for client.

Ted,
Read the help files on establishing an ARQ conneciton. Here is the summary.
1) If you want to call CQ follow the process described. ARQ Call on the Calling menu click Send CQ. This sends a 30 second connect request to call sign CQ (that is not a legitimate call sign so no one will auto answer.)
2) If someone hears your CQ and wants to call you. (Or you want to answer someone else's) you use the Call call sign with their specific call.
3) In the TNC form it shows if you are connected or not and to which station. It also shows whether you are the IRS (receiving station) or the ISS (sending station)
4) To enter data type it into the keyboard text box. Hit <Ctrl> Return to move entered text to the outbound queue. If you are the ISS it will start sending data waiting after each frame for the (AUTOMATIC) ACK from the other side. You NEVER have to manually "Send an ACK or NAK" that is the job of the protocol and its described in nauseating detail in the state diagrams and protocol spec. The V4 TNC implements the protocol just like a hardware TNC implements the Pactor or Packet protocol.
If you are the IRS you won't be able to send until the other side has finished and sends an IDL frame (again totally automatic).
Think of this being the way two people would Talk (hence the name V4 "Chat") He sends ....you listen...when he is done sending, you send he listens. The protocol protects against having two senders or two listeners....Always one is ISS and one is IRS and those rolls are exchanged whenever the senders buffer goes empty (all the data has been sent and ACKed) and the other side (the IRS) as something to send (data in the output queue.) Its all automatic and once a connection is made it requires ONLY typing data into the keyboard box and typing <Ctrl> Enter to move it to the output queue. That mechanism was developed in the early versions to allow you to edit text in the text box BEFORE committing it to transmission.
Read though the help on the ARQ operation and look at the state diagrams. Also look at the V4 TNC form...it shows in big letters who is the IRS and the ISS and which station you are connected to. If you are connected it won't let you send out a connect request ("Not while connected") ...only ONE connection to ONE station at a time in ARQ mode (anything else would be total chaos!).

I can connect , but that is all. No print after a connect and then timeout. This even with a strong signal. FEC mode copies okay. I'm sure this software works great in the path simulators, but just not working for me. I don't want to give up yet as I think a ARQ chat mode program would be useful. I tried this on a Ten Tec Jupiter and a Flex 5000A. I know there are timing issues with a Flex, but I think I have that worked out. This is with Ver. 3.

Howard:
I had a complete (start to end) V4 ARQ contact with Bob, N7DHV, (Florida to Wisconsin) on 6/6/11. We were disconnected a few times for ARQ inactivity timeout which was a bit annoying but were able to reconnect right away and continue the QSO.
Other than the inactivity timeout, it seemed to go quite well if we kept the pace up.

No, no. . . . I don't thnk so because I'm having difficulty as well. We
can connect fine in FEC, but have yet to have an actual successful
ARQ connect and complete communication session..

NR5G and I keep getting timeouts, amongst other things. I only
mention HIM because I don't know if he'll respond to the initial inquiry.

ARQ is good for the soul and will have a positive effect on the overall
U.S. economy when it's perfected in V4. I love Pactor ARQ so I am
assuming I will also have a high regard for V4 as well - the FEC works
splendidly under noisy 40 meter conditions.

Within the confines of the message content below, how many users have
been successful in completing a proper ARQ communication from start
to finish? That's whether CQ/answer sequence or a specific station
(not that there'd be much difference, per se <GRIN>)?

Ted,
Read the help files on establishing an ARQ conneciton. Here is the summary.
1) If you want to call CQ follow the process described. ARQ Call on the Calling menu click Send CQ. This sends a 30 second connect request to call sign CQ (that is not a legitimate call sign so no one will auto answer.)
2) If someone hears your CQ and wants to call you. (Or you want to answer someone else's) you use the Call call sign with their specific call.
3) In the TNC form it shows if you are connected or not and to which station. It also shows whether you are the IRS (receiving station) or the ISS (sending station)
4) To enter data type it into the keyboard text box. Hit <Ctrl> Return to move entered text to the outbound queue. If you are the ISS it will start sending data waiting after each frame for the (AUTOMATIC) ACK from the other side. You NEVER have to manually "Send an ACK or NAK" that is the job of the protocol and its described in nauseating detail in the state diagrams and protocol spec. The V4 TNC implements the protocol just like a hardware TNC implements the Pactor or Packet protocol.
If you are the IRS you won't be able to send until the other side has finished and sends an IDL frame (again totally automatic).
Think of this being the way two people would Talk (hence the name V4 "Chat") He sends ....you listen...when he is done sending, you send he listens. The protocol protects against having two senders or two listeners....Always one is ISS and one is IRS and those rolls are exchanged whenever the senders buffer goes empty (all the data has been sent and ACKed) and the other side (the IRS) as something to send (data in the output queue.) Its all automatic and once a connection is made it requires ONLY typing data into the keyboard box and typing <Ctrl> Enter to move it to the output queue. That mechanism was developed in the early versions to allow you to edit text in the text box BEFORE committing it to transmission.
Read though the help on the ARQ operation and look at the state diagrams. Also look at the V4 TNC form...it shows in big letters who is the IRS and the ISS and which station you are connected to. If you are connected it won't let you send out a connect request ("Not while connected") ...only ONE connection to ONE station at a time in ARQ mode (anything else would be total chaos!).

Hi John, I was in and out of the shack...

What I really miss, during alpha testing is, a third window, so we can observe the flow of data out of the buffer. It is essential..
More or less we sit there and do our things and have no way to know what is flowing out.
During the time we tested together I have never received any data, just by the sound of the audio I could tell that I did send something out of the buffer, just by observing the audio on a second receiver.
What I also miss is, a "QRT" button, not just a "abort" what is more or less a hard cut.

We can do that again, we could try 14073 Khz.. Anyway am stby all day long on 18091.5Khz center USB in V4Chat ARQ and in winmor. In Pactor(1) on 18091.4Khz Mark .

You can try any time. Since we have no bell (or is there one? Control G maybe)I might be out of the shack.

John please tell me if you have received any data from me during our test.

Bob,
This is due to copying an inadvertent ACK from another session on/near frequency (ACKs and NAKs since they are without data are more robust and easier to copy). The next release will include a mechanism insuring a call to CQ cannot cause a connection (ACKs when calling to CQ will be ignored).

Nick,
There does seem to be a need for a "Sticky" with this information. I once (February??) found a page from a US state digital group which had a good list but I lost the link! What I noted down was :

Europe
3590 7040 10136

USA
3583 7073 10131

Worldwide
14073 18085 21073

hopefully others will add to this or correct any errors, as it is pure hearsay.

I too have listened from here in UK most afternoons and left it logging on 14073. A lot of red strikethrough unreadable text. I have noted about 7 green callsigns but only one looked like a really clean CQ and that was 7X4DR which unfortunately the program does not recognise as valid fro an ARQ. I did try FEC but was no reply. Other calls I have observed were your own IZ1OE, and KE1AF KA2UOL, WB0ZYU, N3WT and OH6XI. Actually the last I did not spot in green text but heard his call in CWID and chanced an ARQ call. We connected but failed to transfer text which is perhaps to be expected. It seems that most signals are just not strong enough.

1165. V0.3 problems and CQ connect

Yahoo group: V4Protocol
Date: 2011-06-10 18:29:02 UTC
From: mike.elaine@btinternet.com
Topic: 1165 Message: 1165

Hi I seem to be suffering similar problems since changing over to 0.3.

My setup was fine with the previous V4Chat and I can still operate WinLink with no problems. However, I have had a couple of CQ connects and haven't managed a successful QSO since the changeover.

I've tried linking my main station PC with my laptop (audio crossover cable) and all works fine in both FEC and ARQ. I don't think it's a signal strength problem as I've had successful WinLink connections with signals that appear much weaker than the signals that are failing in V4. I am also seeing a much higher level of spurious strike-through printing on noise than with the previous version.

One minor point - when you close a link with the manual abort the distant station remains in a Connect state until it times out. Might be nice if the manual abort closed the distant station.

Happy to arrange a sked if anyone wants to try some more tests.

I do hope we can crack this as V4 has lots of potential.

Mike G4WNC

1167. ARQ Connect Issue

Yahoo group: V4Protocol
Date: 2011-06-11 06:35:32 UTC
From: Lee Swanson
Topic: 1167 Message: 1167

Rick....

I have recently been communicating with W6IDS over cell phone while both of us were running tests on ARQ connectivity with V4.
Here is what I have observed. When issuing an ARQ connect request to W6IDS under marginal band conditions on nightime 40 meters, the IRS station will decode my connect request and indicate to him that he is connected to my station. He then responds immediately with an ACK. At that point my station does NOT appear to decode the ACK. This leaves his station showing CONNECTED and my station continuing to indicate DISCONNECTED. This continues until a "timeout" occurs. Is it possible that the ACK data bursts might be ever so slightly too short to be properly decoded under poor band conditions such as static crashes and/or weak signals? Do you think that by increasing the length of the ACK signal would do a better job of purging the IRS station's receiver so that it can decode more consistently while in ARQ mode keeping mind. I would suspect that

This exchange has rendered the same exact results when the other station is the initial ISS making the ARQ connect request.

You thoughts please...

What I had happen was a ending up with a connect to CQ when calling CQ arq hooked up to a dummy load where there was little to no possibility of receiving a signal from some other station. Have made a number of contacts on ARQ but sometimes ther is no connect from what appears to be a timing issue. I usually abort and try to reestablish the link. Most of my operation has been on 14.073 MHz. We are very interested in using V4 ARQ in MARS for error free delivery of message traffic. Larry K4LLQ/AAT3PY

Lee,

The ACK, NAK and IDL signals are exactly the same as the first part of a data frame except the code is different. Normally an ACK/NAK or IDL will decode easier since it has no data and only has to receive the leader and the 4 symbol Sync field (that field decodes whether it is FEC data, ACK, NAK or IDL).

If there is a problem in receiving the ACK it is most likely there is excessive Hold time on the station sending the data. By that I mean the PTT is held too long not allowing the receiver to switch on and copy the ACK. If for example the sender is using VOX (either transceiver VOX or VOX built into the sound card interface like the SignaLink USB) any added Delay or Hold could block the ability to decode the ACK. This mentioned at least 2 or 3 times in the setup instructions in the Help. If the transceiver switches in 100 ms or less there is no problem and virtually all modern transceivers will do that.

It is possible to adjust the timing and I will look into that but the timing is already fairly generous. Making it very sloppy (e.g. delaying the remote station's ACK is possible but it requires stretching the entire cycle and that degrades throughput. Better to have users set it up correctlry...many are not used to ARQ and its rapid T>R switching so leave there delay settings at something slow like those used in PSK etc.

Hello,

Using V4Chat I am trying to get my TS-140s to switch to send, but to no avail. I have tried all sorts of combinations in the Radio Setup window.
No problem with MixW or DM780 to switch to send.
Anybody out there who has solved this problem?

Hi Rick, Lee,

I've been attempting some testing here in the UK with Bob G3WKW. Last eveneng we had reasonable signal conditions on 80m and attempted an ARQ QSO. The initial connection was made very quickly with both stations showing connect but the IRS was only sending ACKs very intermittently (only two or three before the time-out limit was reached). Each of the transmitted ACKs were recognised at the ISS but most of the time there was complete silence in between the transmit bursts - no sign of a curtailed ACK. It would seem that the IRS was just not responding despite what sounded like an acceptable signal quality. In the end, the link just timed out with none of the message being conveyed. This aligns with my experiences with other ARQ attempts using v0.3. By way of comparison, the signal levels last night were significanly better (10dB or more)than conditions where I have had successful WinLink (Winmor) contacts. I'm using PTT Tx/Rx switching this end and my station worked fine with the 0.2 software. I have also run audio back to back tests with my laptop and under those conditions the software works fine.

Hope this helps give a few clues. Happy to carry-out more specific tests if that would help.

Topic: 1167 Message: 1176

All,

This unfortunately is not much information. There are about 30 things happening during the recognition of the leader, the symbol sync, the frame sync and the frame type decode and the data decode. The debug log is the key to making any progress here. I hate to sound like a broken record but unless you enable the debug log, Describe the type and time (UTC) of the observed problem it is not likely your word description will provide any useful information.

For your info when I work on issues with the protocol (timing, logic, DSP sensitivity etc) I ALWAYS have the debug logs of two computers (each end of the connection) working and capture everything while running the audio through the HF simulator (usually at −5 dB S/N Multipath poor channel). Without having that debug log it is impossible to tell what is happening inside the DSP code and protocol.

I am working on a number of issues for improved robustness but it is a big help to also have real off-the-air data if it is properly logged. Having logs from both ends is about 5x better than just one end of the connection!

Send your debug logs with reference to the time of the observed problems directly as attachments to rmuethingATcfl.rr.com and I will try and take a look.

To make Rick's life a bit easier, please ensure that your computer's clock is accurate allowing the time stamps in the logs to be correct. An excellent NTP client called "Dimension 4" is available for free download. Accurate times in logs are critical when sending Rick logs from two stations experiencing a particular problem.

Indeed, uploading our V4 QSOs to Logbook Of The World isn't going to work until this is resolved as well. Makes it tough to popularize a mode when the National Association for Amateur Radio isn't keeping-up with these new developments. :)

It's a shame we can't get a new mode into the ADIF spec in a more streamlined way.

Ideas?

I'll be available at times over the weekend. Is there a particular time of day you had in mind to make an attempt with European stations? That would help in finding you QRV without continually monitoring all day long. Please give us an idea when you'd like to try. Propagation between ZS and DL are pretty good but 17 or 15 meters may be better on North/South paths.

1187. Trial Update to the V4 TNC uploaded to Yahoo FTP

Yahoo group: V4Protocol
Date: 2011-06-20 16:11:52 UTC
From: kn6kb
Topic: 1187 Message: 1187

All,

I am on vacation for a few more days. Did some work here the other day when it was too hot to do anyting else! I have uploaded a trial patch for the V4 TNC (Filename V4 TNC Patch 0.3.0.1.zip). It contains a new TNC version which should be better in terms of sensitivity and symbol sync. I don't have my HF channel simulator here in the RV but it appears to be significantly better using an audio test with very low levels and noise. When I get home I'll run additional tests and tweaks using the HF simulator but some may want to try it now. This updated also includes an automatic calculation for timing during the initial ARQ connection. This should now automatically handle both fast turnaround and slow turnaround setups (slow computers etc). This also uses a mechanism to insure a CQ call does not recognize an inadvertent ACK.

This new version 0.3.0.1 should be compatible with the prior 0.3.0.0 version but should perform better. Try playing some with the squelch setting though 5 should be a good starting point and should work for all but the weakest signals.

What I am most interested in is:
Is this new version more sensive in detecting and syncing signals?
Is the ARQ mechanism working OK and useful on poor signals?

To use this new version simply download the zip file. Unzip and repace the V4TNC.exe file in your V4Chat directory. Keep (rename) your current V4TNC.exe file if you want to go back. You do not need to do an uninstall/re install. Simply replace your V4TNC.exe with the one in the zip. The revision history summarizes what changed.
Your comments welcome. Good luck.

73,

Rick Muething, KN6KB

V4 TNC Revision History

Date Rev # Summary ofChanges

June 20, 2011 0.3.0.1
Add blnARQCQ to block inadvertent ACK while calling CQ
Add function AcquireSymbolSync to V4Demod to use FSF filtered values to determine sync (more accuracy)
Modify function SearchForAMLeader47B2 to only do Tone search and call AcquireSymbolSync only when Threshold criterial are met.
Added variable intMeasuredPTToffToACKDelay to calculate actual ACK Delay in ARQ mode.
Modify intARQSpacing based on the measured intMeasuredPTToffToACKDelay value.

1188. V4 QSO V31AE <-> OH7TE

Hi Yussi, your sig was buried in the noise floor, no s-meter reading, it is (positive) that we could have (under bad sig/noise) part of a qso. Still it is very difficult to imagine what is flowing out of the buffer, besides that we see how many bites ar left in the buffer (or not) . WE NEED A STATUS LINE, it helps a lot testing and improving!!! Many times the constellation window doesn't show anything (score)or ACK percentage? like in the winmor tnc. It is hot here too! :-)
I would have changed the band, to 18Mhz, but how to tell u that? I did send you a msg using winlink and telnet but no reply.
let's see...may be later again. Getting darkish now, lots of rain we had and the road is just a pile of mud...Not kidding!

I installed the V4 TNC Patch 0.3.0.1.zip on 06/21/11. I copied CQ's by EA3AQS, K1LLQ, N3WT, V31AE, and WB6JFH all on 14.073 Mhz during the day, but got no replies when I called them. I also called CQ many times as well, but got no replies. The equipment is working normally here with other programs on other digital modes. Is anyone else coping but not getting any replies?

Its always easier to give up than to work towards an improved solution. Thankfully there are still those involved with Ham radio that believe there is still has room for experimentation and advancement.

Did you know that the first bipolar transistor invented by John Bardeen, Walter Brattain and William Shockley in 1948 had a virtually useless beta (gain) of about 2. Good thing they didn’t give up!

Someone wisely said that progress is 1 % inspiration and 99% perspiration. I can vouch for that!

I found the patch a great improvement with very few false decodes on noise and had 2 fairly successful QSO first night. But on a third QSO with apparently reasonable signal it failed to change from ISS to IRS despite endless handshaking, well it ended with timeout. I will send the log.

Jeez, you reminded me.

Wayyyyyyy back when, I remember opening Popular Electronics and seeing an article about this new device called the Transistor. It was touted as being able to be used for much faster circuits and switching, etc. and would ultimately replace the vacuum tube. There was even a little circuit you could copy to test the Transistor as it switched from on to off to control a small light.

I forget where you were to find this thing, it was so new at the time. But, I do remember the article. Hmmmm, must have had an effect on me.

OH and with regard to the perspiration, it also means that you're not disappointed for not getting immediate gratification, Rick.

1198. Newbie question: what is "Incorrect mode (ARQCONNECT CQ) ???

Yahoo group: V4Protocol
Date: 2011-06-23 08:46:31 UTC
From: sp5isz
Topic: 1198 Message: 1198

Greetings,

I have just installed the software (0.3.0.0) and tried it. It seems to be able to receive and transmit from TNC window (Two Tone Test and Send CWID commands switch the radio to TX and send tones into air). But:

1. V4 Sound Card TNC "Busy" status keeps showing "Busy (N)" or "Busy V4" while listening to the RX noise. When I shut it down with radio squelch, noise tracks disappear from the waterfall and the message "Channel Clear" appears

2. Whenever I try to transmit anything from V4 Chat window (in ARQ mode tried to make it send CQ - from ARQ Call command or from keyboard entry) there is no transmission at all, a red "*** Incorrect mode (ARQCONNECT CQ)" appears, and new entry in Greek is added to the log. The result is the same, irrespectively of the channel busy status described above.

Kenwood TS-480, Soundblaster Audigy, Win XP Pro SP3.

Huh?

You did not say if you have also downloaded the TNC patch 0.3.0.1 released on Monday. I too have seen the "Incorrect Mode" message but it has always been fixed by using the dropdown menu "Mode:ARQ" and selecting ARQ. Something somewhere seems to think it is in FEC mode. I is not happening all the time, I had thought it was when changing bands, now wondering if it is after a 2 tone test will try that avenue later.

Read the help on the busy detector (that is what turns on Busy N, Busy W or Busy V4. It can be tweaked if necessary using the squelch control on the V4 TNC panel (not the squelch on the radio which must always run open squelch) Normally you should be able to run with the squelch near the center (values 4-6). The squelch also tweaks some of threshold parameters on the leader detector.

If you have a problem enable the debug log and send the debug log to me directly as an attachment to rmuethingATcfl.rr.com. The log tells all to someone familiar to the program and is the ONLY practical way to debug!

Perhaps it would be useful to know what power you and each of these stations is running. I typically use 20 or 40 watts but have no idea what others are using. Of your list I have worked V31AE but he found me hard to copy but I think the local noise there was significant.

From: Bob Thornton
Topic: 1198 Message: 1204

I have been looking at this Incorrect Mode message, and can reproduce it reliably. It seems that when you make a two tone test the V4 TNC window clearly shows that the mode changes to FEC. But the chat window will still show that ARQ is active, and then when you try to call CQ (or another station) the "Incorrect Mode" message is displayed and you have to use the "Mode:ARQ" dropdown to select ARQ which you think is already selected. So the workaround would be to always reselect ARQ mode after using the Two Tone Test.

Hi Bob...

I believe between Europe/Americas at 22/23 UTC, both sides using a beam/50 Watts you can expect S5 qsb. Am sure under this condx you can have a successful V4chat ARQ qso. I believe also, that the latest V4 version performs better...
For your information, am running 50 Watts into a T8 log periodic (8 elem) 13 to 30 Mhz pointed 45 degrees covering the USA east coast and Europe.
I am very interested how the V4 protocol performs under very difficult condx. I am running a daily (on the other side unattended) qso on 10 Mhz with HB9BJJ, using a 1/4 wave vertical on top of a metal roof very close to sea water. Using the first ever sold PTC modem type from SCS 25 years old!..The vertical is quite noise,the signal I receive is buried in noise... Ones only I have lost a connection maybe out of 30..
18 Mhz is a very interesting band. Am most of the time parked there listening for pactor1/winmor calls. If I can hear V4 sigs there I usually try and answer that call...

1206. V4Chat client v 0.3.0.0

Yahoo group: V4Protocol
Date: 2011-06-24 03:14:39 UTC
From: Robert Belize
Topic: 1206 Message: 1206

Rick,

* I started the v4chat' what brings up the TNC and the client in ARQ mode.
* cursor is in the receive window.
* click into the tx window, what brings the cursor down.:-)
* type some text :1234567890123456" into the tx window.
* press control enter.

These 16 chr will be sent and received by any station out there, and repeated. Why is that? Fec? TNC says it is in ARQ mode.

During test qso's it happens times over that 16 Characters will be sent and repeated over and over.
It happened to me today again...

Please advice.

Rick,

I should have added that ARQ timeout is set to (30) sec, and AutoId is off. I started the sequence 5 minutes ago, and it is still repeating/transmitting the 16 characters.

Topic: 1206 Message: 1209

Robert,

Some things you must understand with ARQ.

1) ARQ uses FEC (Forward error correction) to send the data...That means there is redundancy in the data to allow some error correction (not infinite error correction of course!)
2) An ARQ “Connection” is between TWO stations. More than 2 stations CANNOT use ARQ at the same time. One station is always the ISS (The information sending station) while the other is the IRS (Information receiving station). During a normal QSO the rolls of IRS and ISS typically exchange several times. The V4 Protocol (see the ARQ state diagram) controls how the exchanges happen and should insure you can’t get a situation with two ISS or two IRS stations.

3) The ARQ timeout should normally be more than 30 seconds...I would say 60-90 seconds. That means if you don’t get an ACK from a transmission in that time period the link is lost. If it is too short a temporary drop in propagation will kill the link prematurely.

4) You normally don’t just send data in ARQ if you are NOT connected. I will look at blocking that in the software. For an ARQ connection the procedure (as it is in almost all ARQ modes) is this:
a) Call CQ using the ARQ CQ. This is limited to 30 seconds and with the latest 0.3.0.1 TNC version will also NOT accept any ACKs ...There is no station with the call sign of “CQ” so no one SHOULD ACK.
b) Some one Answers your CQ (or you call to a station that sent a CQ) or (you call to a station on a Scheduled time and frequency) and if/when they ACK that forms an “ARQ Connection” connecting those two stations. From that point they are either IRS or ISS and exchange FEC data via the V4 ARQ protocol. When finished you can abort the link (preferred) or just let it timeout.

FEC mode is a different animal. There is no “connection” Perhaps there is a better name for this (Unproto in packet). In that mode the data is still sent FEC (the same exact format as in ARQ above) so some errors can be corrected. But since there is no “back channel” there is no mechanism to allow the other stations (or stations) to automatically request a repeat. So FEC mode cannot correct all errors and is best for good conditions or when “broadcasting” to several stations.

In ARQ mode the current software allows you to copy and display FEC data when NOT connected ...This using the same Green (Error free) or Red (CRC failed) text as is used when in FEC mode. When connected in ARQ text is always displayed as bold black and is always error free (or the link eventually fails).

Hope this clarifies things a bit. I am still working on refinements to the demodulation and decoding. This is a constant battle between better performance using more DSP and available CPU horsepower. (part of the “no free lunch” theorem!)

Jack,

That is basically correct but It's a bit more complicated out of necessity.

If the ISS sends a frame (up to 16 characters) it expects back an ACK (frame received and decoded successfully) or a NAK (messages received but decode failed CRC check)
But the ISS also has a timeout (slightly longer than the expected ACK or NAK reply time) so if it receives NO reply (or the ISS failed to decode the reply) the logic treats it like a NAK and the ISS resends the same frame.

If the IRS sent an ACK but the ISS failed to receive it the ISS will resend the exact same frame but since the IRS has already received it the IRS will ignore the duplicate frame but still send the ACK or NAK. This insures no duplicates are passed through to the application.

In any ARQ scheme it is virtually imperative that one station be in control and the lost of any particular frame or ACK not stop the protocol. That is why the above mechanism is required. The ARQ state diagrams (though simplified) show this basic operation.

Rick,

the reason I have set the ARQ time out timer to 30 sec was, to check if there was any routine in your code what would stop the transmitter sending 16 Character endlessly (there is no watchdog) , resulting finally in overheating.
I have seen those 16 characters sent by other stations, unaware of it.

In my opinion, the client should not provide the possibility by mistake, to send out (transmit) 16 characters, without being connected.

Robert,

The fix is that the software should prevent you from ever sending data in ARQ mode unless connected. That will be in the next release. In ARQ mode there is always a timeout while connected.

Thanks for the feedback.

Rick:

I had a QSO with Robert last night and we both had the issue with the constant repeats. Also, please consider using adapter timers as I suggested in a previous post.

Have a look at:
http://www.icao.int/anb/Panels/ACP/ATNP/Meetings/wg2/wps/w2wp345.pdf

Adaptive timers become very important when there are multiple stations on the same frequency.

Bernie,

I looked at the document and while it is aimed at typical network type timing there are some areas for adapting to use a variable timer. The next revision of software will include a mechanism that measures the round trip delay and use that to optimize the timer value. What I call the round trip delay is this:
Start Round Trip measurement when the ISS station releases its PTT signal
Measure time (true resolution about 10 ms) until the ACK or NAK of the responding station is received. There is still a timeout on this (larger than any normal reply value) in case there is a lost ACK or NAK.
Use that measured time to create a new more optimum (shorter) ARQ repeat interval. This interval will be used for the duration of the ARQ session and will have some safety guard band (in the order of 100-200 ms or so)

This should work because the primary elements affecting the round trip delay measurement are:
1) RF Transit time (both directions) generally pretty small but could be over 100 ms
2) Leader time at the station sending the ACK/NAK (Leader length is a function of VOX or non VOX operation)
3) OS and sound card latency at both ends (Captured sound card data is buffered at least 1 symbol (~ 21 ms) at each end but can occasionally (Windows is not a true Real time OS) be a couple symbols longer than that.
4) CPU Processing speed. After a full frame is received by the IRS it must be decoded (Viterbi Decoder) and the correct reply composed and queued to the sound card. Depending on the CPU this adds some time but normally < 50 ms.

While Items 3 and 4 are somewhat variable depending on the CPU loading They can be handled with a fairly small margin of 100 to 200 ms and still be safe (that pad or margin has a relatively small impact on net throughput ...perhaps 3-5 %).

The next release will include an automatic calculation of this delay (calculate independently for each end) and use those values during the ARQ session. A new optimum delay will be computed for each end on each ARQ connect.

FYI WINMOR uses a similar procedure to measure and adjust for round trip delay.

Now as for your comment on “Adaptive timers become very important when there are multiple stations on the same frequency.” I don’t think this really applies to those modes that do not share frequency (Pactor, Amtor, V4, WINMOR etc). Those mode unlike Packet are not designed to run simultaneous connections on the same frequency. Supporting multiple connections on one frequency adds a large amount of overhead (e.g. HF Packet for example) and was never intended for V4. Trying to run two connections on the same frequency results in total chaos for the protocol as it does for most single connection ARQ protocols above.

For those of you who are having solid ARQ chats on V4, I would be interested to know the location of the two stations in ARQ qso, the distance between the two stations, the band being worked and the local time of day the qso is taking place along with a report of noise conditions. Obviously the software is working but not for everyone. I'd like to think that most if not all stations are operating radios that drop out of transmit quickly enough to get a good decode on ACK/NAK responses. I think my inability to carry on an ARQ chat is mainly due to poor band conditions. Oddly enough the other night I carried on an ARQ qso around 0500z on 20 meters between Dallas, TX and Long Island, NY. using mode ALE400. The qso lasted 45 minutes until the band finally died out.

Rick

I don't think I ever expected V4 to handle more than one ARQ connection
at a time. But can V4 handle multiple ACKs on a busy frequency arising
from many different (unrelated) connections, ignoring all ACKs other
than the one it expects to hear at any given time?

Or is it possible for V4 to erroneously respond to an ACK belonging to
another (unrelated) connection?

Ian,

V4 currently does not “Connection Encode” the ACK/NAK (actually only ACKs and IDLs are critical). That could be done by for example including an extra data field in the ACK that is some hash of the two connected call signs. WINMOR does this because it was necessary to reliably transfer compressed binary blocks but it adds significant over head on the ACK so I wanted to avoid this on V4. If it really turns out to be a problem it could be added at the expense of sending an extra 8-16 bits Plus FEC (probably an extra 300-400 ms or so) to the ACK. However since V4 is not sending blocks of compressed binary data and will not work well with multiple sessions on the same frequency it seems to be an unnecessary overhead. Without using spread spectrum or time share mechanisms it is not really possible to have multiple connections on the same frequency. The same applies for PSK31 or most other modes.

In an ARQ mode you want to keep the ACKs as simple and short as possible to maximize the likelihood of detection and minimize the overhead. Adding additional data and strong FEC really negatively impacts throughput especially when trying to keep the frame length short (for “slickness”) as in V4.

In short all engineering is a compromise! Anything can be made more fault tolerant but then again its important to remember that someone once joked that an Elephant is a good example of a fault tolerant mouse!

From: Paul Whitaker
Topic: 1206 Message: 1223

Hi Rick,
We are using V4Chat with good success in Melbourne Australia.
My hat off to you for the development. I am constantly amazed at the dedicated & expert people who are involved in AR.
Further, your hands on approach with the others using the protocol is commendable.

I am using Icom IC706 with home made interface. I also was able to replicate the error after sending test tone. Easily stopped.
At this stage, there are 3 of us in the group using the protocol, but we are working on getting more up and running.

I have one question, is there a way to get a 'Beacon' type CQ transmission happening ? It would be useful for achieving recognition, possibly to cancel when signal received.

Keep up the great work. It is looking most useful for our EMCOMM group - Net operations, coupled with WINmor for EMail. Pity its not all in the one package !

Cheers '73

Hi Rick

All understood. However, I am not suggesting you should *intentionally*
handle multiple connections on the same frequency. My question was
whether V4 could *unintentionally* respond to multiple ACKs on the same
frequency when those ACKs belong to other connections -- just too many
stations on the frequency at the same time.

Thanks Paul,

I hope to have a new release out this week to address some of these issues. However I am reluctant to create or enable any automatic “beacon” or CQ on HF. With widespread use these can be huge QRM generators and we don’t need more of that! The concept behind V4 Chat and the V4 Protocol is that it is an active live keyboard mode. There are already modes (like WINMOR) for message passing and continuous automatic server operation.

1227. Noobie Question for ARQ

Yahoo group: V4Protocol
Date: 2011-06-25 20:03:35 UTC
From: wb4son
Topic: 1227 Message: 1227

Twice I have called CQ on 14073 and been answered by stations. I can hear the ACKs, it seems to be fine. My station is tagged as the ISS on the TNC screen.

So, my question is this, what other than <Ctrl><Return> is needed to get anything sent out? I type into the textbox and hit <Ctrl><Return> to try and send it. The text then appears in the same text box with the connection status information, but the "Bytes queued" ont he upper right of the TNC window remains at zero. Eventually the connection times out after a long period of both ISS and IRS acking back and forth.

And since I've never had a QSO work before, what is it that changes from ISS to IRS? Is it the <Ctrl><Return> that initiates transmission then presumably when the buffer goes to zero switches to IRS?

Sorry to be so thick -- maybe it is just bad propagation, but the second time, the signals were quite strong and looked decent on the waterfall.

73, Bob, WB4SON

PS running 0.3.0.0 Chat and 0.3.0.1 TNC

> Now as for your comment on â□□Adaptive timers become very important when there are multiple stations on the same frequency.â□□ I donâ□□t think this really applies to those modes that do not share frequency (Pactor, Amtor, V4, WINMOR etc). Those mode unlike Packet are not designed to run simultaneous connections on the same frequency. Supporting multiple connections on one frequency adds a large amount of overhead (e.g. HF Packet for example) and was never intended for V4. Trying to run two connections on the same frequency results in total chaos for the protocol as it does for most single connection ARQ protocols above.

From: Bob
Topic: 1227 Message: 1237

Please, NOBODY has any help for a new V4 user?

I did read the manual section for ARQ and it says that <Ctrl><Return> should shift to the xmit buffer, but that does not appear to be happening in my case. Is there something obvious that I've failed to do?

Sorry to be a pest, but I don't want to try this again on the air until I figure out what stupid thing I'm doing that is wrong.

Bob,
Let me suggest you download and install the latest version which I just uploaded 0.3.0.1. You will have to uninstall your current version and re install the new one. None of your settings will be lost.

The new and current rules are fairly simple:
1) You can't send FEC text in ARQ mode UNLESS you are connected. Read about calling a CQ or calling another station in the Help. If you try and enter text and transfer it to the outbound queue (buffer) in ARQ mode while you are NOT connected you will get an error message box.

2) You can always send text in FEC mode or in ARQ mode if connected by entering the text and typing Ctrl <Return> Hold control down while you hit return.

Remember you can do all this without transmitting for practice simply by turning off the radio. The sound card should still work. If you select your local windows sound card and speakers you can also hear the audio for practice if desired.

1241. New Update 0.3.0.1

Yahoo group: V4Protocol
Date: 2011-06-28 17:33:47 UTC
From: Rick Muething
Topic: 43 Message: 1241

All,

I have posted the latest update 0.3.0.1 Please read the revision history for details of changes from prior versions. You will have to uninstall your existing version and re install using the new Install contained in the zip file. None of your settings will be lost. I would recommend trying different squelch settings to determine which works best. Normal range should be values of 3 to 7 with 5 a good starting point. You set the squelch level on the V4 TNC form.

I had a serious problem with my laptop which crept into my development computer due to a damn virus (snuck in via the WiFi network at the RV park despite current Anti virus program). This will require that I rebuild both computers and re install all the development software so it may be a week or so before I can make any new updates.

FWIW if I ever find one of these virus writers he/she will have to re learn how to type with their elbows!

73,

Rick KN6KB

V4 TNC Revision History

Date Rev # Summary ofChanges

June 20, 2011 0.3.0.1 Add blnARQCQ to block inadvertent ACK while calling CQ
Add function AcquireSymbolSync to V4Demod to use FSF filtered values to determine sync (more accuracy)
Modify function SearchForAMLeader47B2 to only do Tone search and call AcquireSymbolSync only when
Threshold criterial are met.
Added variable intMeasuredPTToffToACKDelay to calculate actual ACK Delay in ARQ mode. Modify
intARQSpacing based on the measured intMeasuredPTToffToACKDelay value.
Test for Two Tone, loop back and CW ID now disable those menus until completed
Two Tone test no longer changes mode to FEC

June 24 2011 0.3.0.1 Add test and message box to prevent Calling CQ or Station if already connected
Add test and message bos to prevent sending Text in ARQ mode if not connnected.

1246. V4Chat v 0.3.0.1 ARQ test

Yahoo group: V4Protocol
Date: 2011-06-29 02:03:57 UTC
From: Robert Belize
Topic: 1246 Message: 1246

This is what I have observed.

My setup: Station 1: Laptop / SignaLink / IC-746 / low rf power (V31AE)Station 2: PC / SignaLink/ TS-140S/ low rf power (V31TST) is a test call sign only)
Both station are setup side by side.
* Both station are in ARQ mode stby (disconnected IRS)
* Station 1 call station 2
* Connected
* Station 1 sends text "line 1"
* Station 2 receives and reply's with "line 1 V31TST"
* Station 1 sends text "line 2"
* Station 2 receives and reply's with "line 2 V31TST"

Both TNC show accordingly IRS or ISS or ISS >IRS, text flows, no problems..
Now, if I start typing text into station 1 and into station 2 at the same time , and repeat that, problems will start.

* Both TNC's show Status: IRS>ISS (it will not change)
* On both TNC the busy indicator is permanently "on"
* Both TNC's show: 0 bytes cued
* Both TNC constellation windows are black

Nothing happens anymore. Both station idle out after the set time of 180 sec.
Robert V31AE

Yahoo group: V4Protocol
Date: 2011-06-29 02:19:35 UTC
From: Bob
Topic: 1227 Message: 1247

Hi Rick,

Thanks so much for responding. I am running 0.3.0.1 of the TNC software.

I do see a 'connected to message' in the ARQ mode when someone responds to my CQ and I can hear the radio ACKs chirping away on his end, so it is connected. The TNC screen says I am the ISS, so that means I should be capable of sending data..

As you suggested I am typing my text then sending <Ctrl><Return> to transfer it. I see it appear in the upper text box when I do that, so I think I've done the right thing. However the buffer count doesn't change from zero (maybe it sent it so quickly?), and I never see the other station type anything. Also the chirping between my radio and his doesn't change -- it isn't sending anything new. So it sort of sounds like I am doing the correct things, but for some reason things just aren't working out between the stations.

RF level, ALC level, and monitor receiver show that I am sending tones. In fact the very fact that I can call CQ in ARQ mode, will see someone show up on the constellation display and see a connected message seems to imply that all the rig related issues are fine. There are no error messages of any kind. It just sort of keeps chirping away for a minute or two until the other station drops out or I hit Abort.

I'll keep trying!

1248. RE: [V4Protocol] Noobie Question for ARQ

Yahoo group: V4Protocol
Date: 2011-06-29 04:07:42 UTC
From: Lee Swanson
Topic: 1227 Message: 1248

I read all the V4 Protocol traffic and try to learn all I can from everyone's input concerning the ARQ connect issues that several of us are having. Rick just might be on to something with what he mentioned recently on "soundcard latency"... That would explain to some degree why some stations are having good ARQ exchanges and others are not. I am one of those who is NOT.. I could very easily be a slow soundcard along with noisy and poor band conditions. I too, am one who notices during an ARQ attempt that a connection indication takes place but after that, no data flow, no bold black print and a "star-less" constellation display indicating the lack of decoding. I seem to copy good CQ calls when signals are fairly loud and free of static crashes. 20 and 17 meters have been pretty quiet lately. 40 meters, well, you all know all about the nighttime noise on 7mhz. The tnc appears to decode very well under fairly quiet band conditions but even then, an ARQ exchange on this end has been near ZERO thus far. I will add, when I first installed and early version, I did SEE.....about 5 characters of BOLD BLACK text and that has been all the error corrected copy I have experienced. This is part of what makes amateur radio so much fun, the experimentation, trial, error...and for some.....success!! I remain confident.... V4 Chat will ROCK.....

Hi Rick,

Thanks so much for responding. I am running 0.3.0.1 of the TNC software.

I do see a 'connected to message' in the ARQ mode when someone responds to my CQ and I can hear the radio ACKs chirping away on his end, so it is connected. The TNC screen says I am the ISS, so that means I should be capable of sending data..

As you suggested I am typing my text then sending <Ctrl><Return> to transfer it. I see it appear in the upper text box when I do that, so I think I've done the right thing. However the buffer count doesn't change from zero (maybe it sent it so quickly?), and I never see the other station type anything. Also the chirping between my radio and his doesn't change -- it isn't sending anything new. So it sort of sounds like I am doing the correct things, but for some reason things just aren't working out between the stations.

RF level, ALC level, and monitor receiver show that I am sending tones. In fact the very fact that I can call CQ in ARQ mode, will see someone show up on the constellation display and see a connected message seems to imply that all the rig related issues are fine. There are no error messages of any kind. It just sort of keeps chirping away for a minute or two until the other station drops out or I hit Abort.

I'll keep trying!

73, Bob, WB4SON

Subject: Re: [V4Protocol] Noobie Question for ARQ

Please, NOBODY has any help for a new V4 user?

I did read the manual
section for ARQ and it says that <Ctrl><Return> should shift to the
xmit buffer, but that does not appear to be happening in my case. Is there
something obvious that I've failed to do?

Sorry to be a pest, but I don't
want to try this again on the air until I figure out what stupid thing I'm doing
that is wrong.

That sounds to me exactly what seems to happen in real QSO. It doesn't change mode smoothly.
Also last night while in a ARQ connected QSO with Jussi OH7TE I suddenly found a "Connected to V31AE" message. I am guessing we were both in separate QSO and not hearing each other and then a lift just crossed our wires. But no forced abort of the QSO with Jussi, so it felt wrong. I am sure Rick will repeat that V4 is for one QSO on one channel at one time, but that was clearly what both (or all 4!) parties thought they were having.
While watching a blank waterfall and getting a lot of red decodes on "noise" again, I was surprised to see one single frame suddenly appear in green error free text. I could not hear the signal at that time but clearly it was there.
Again while connected to Robert I had one decode of black bold text that was complete gibberish. Perhaps Robert was in despair!

I will look at the log, note the times of these events and send it on to Rick.

We probably need to be moving up a channel or 2 when a new release appears. Is a 200 Hz step sufficient or should we use 250Hz "channels". I guess it depends on the relative signal strengths.

Dave,

The only time a 0 is inserted is during a CQ or a call to another station. There is a specific format used to insure the sending and target call signs with their -ssid fit into the 16 character frame and the "0" indicates no -ssid an ssid of 1-15 would show as a 1 to F

Again as in 99% if the debugging we do.Including your debug log will provide me many many times the information that a word description in an email.

****
This is what I have observed.

My setup:
Station 1: Laptop / SignaLink / IC-746 / low rf power (V31AE)
Station 2: PC / SignaLink/ TS-140S/ low rf power (V31TST) is a test call sign only)

Both station are setup side by side.
Both station are in ARQ mode stby (disconnected IRS)
Station 1 call station 2
Connected
Station 1 sends text "line 1"
Station 2 receives and reply's with "line 1 V31TST"
Station 1 sends text "line 2"
Station 2 receives and reply's with "line 2 V31TST"

Both TNC show accordingly IRS or ISS or ISS >IRS, text flows, no problems..

Now, if I start typing text into station 1 and into station 2 at the same time , and repeat that, problems will start.

Both TNC's show Status: IRS>ISS (it will not change)
On both TNC the busy indicator is permanently "on"

Both TNC's show: 0 bytes cued
Both TNC constellation windows are black
Nothing happens anymore. Both station idle out after the set time of 180 sec.

From: Rick Muething
Topic: 1270 Message: 1271

David/All,
This is exactly as designed. The Connect request and CQ frame have the same syntax and that syntax packs both call signs (including optional –ssid) into a 16 character frame. To do this a simple but effective and efficient coding scheme is used:
Characters 1-8 Target call sign defined as:
The call sign (up to 7 characters) + a following character 0-F . “0” defines no ssid used, “1” defines ssid of –1, ...”F” defines ssid of –15.
If a call sign with ssid desgnator is < 8 characters it is null padded (note a null is not the character “0” but a byte of value 0 which is not printable)
Characters 9-16 are as above but are for the calling call sign.
So “CQ0KB0E0” is really the 16 character string representing:
“C”, “Q”, “0”, nul,nul,nul,nul,nul,”K”,”B”,”0”,”E”,”0”,nul,nul,nul
and is interpreted as
Calling call sign “CQ” with no –ssid from call sign KB0E with no ssid
The syntax is exactly the same for one station calling another except the CQ is replaced by the target station call sign.
The software decodes the above as a connect request (if not connected) and checks the validity (proper MARS or HAM call sign) syntax. Since “CQ” is not a valid call sign there should never be a station that would answer a call to CQ. It serves the same purpose it does on CW or Phone...to indicated to any station listing that the calling station wishes to connect to anyone. It is followed by (just as in the CW or SSB case) with a return call to the station calling CQ.
It is possible to suppress the printing of such special decodes but in the interest of allowing monitoring it is displayed in both FEC and ARQ modes.
Hope this answers the question. I will make sure it is explained clearly in the protocol document.
Rick KN6KB

1275. Re: [V4Protocol] text

Yahoo group: V4Protocol
Date: 2011-07-03 18:11:46 UTC
From: Fred G -w1wyc
Topic: 1270 Message: 1275

David,

Check out Rick KN6KB's write-up from earlier today. He describes the "o" as seen in the text.
If you didn't get it I have included it below.

Fred, W1WYC

David/All,
This is exactly as designed. The Connect request and CQ frame have the same syntax and that syntax packs both call signs (including optional -ssid) into a 16 character frame. To do this a simple but effective and efficient coding scheme is used:
Characters 1-8 Target call sign defined as:
The call sign (up to 7 characters) + a following character 0-F . "0" defines no ssid used, "1" defines ssid of -1, ..."F" defines ssid of -15.
If a call sign with ssid desgnator is < 8 characters it is null padded (note a null is not the character "0" but a byte of value 0 which is not printable)

Characters 9-16 are as above but are for the calling call sign.

So "CQ0KB0E0" is really the 16 character string representing:
"C", "Q", "0", nul,nul,nul,nul,nul,"K","B","0","E","0",nul,nul,nul
and is interpreted as
Calling call sign "CQ" with no -ssid from call sign KB0E with no ssid

The syntax is exactly the same for one station calling another except the CQ is replaced by the target station call sign.

The software decodes the above as a connect request (if not connected) and checks the validity (proper MARS or HAM call sign) syntax. Since "CQ" is not a valid call sign there should never be a station that would answer a call to CQ. It serves the same purpose it does on CW or Phone...to indicated to any station listing that the calling station wishes to connect to anyone. It is followed by (just as in the CW or SSB case) with a return call to the station calling CQ.

It is possible to suppress the printing of such special decodes but in the interest of allowing monitoring it is displayed in both FEC and ARQ modes.

Hope this answers the question. I will make sure it is explained clearly in the protocol document.

Rick KN6KB

Roger. I tried both but did not see you in either option.

We are in the process of creating a "radio room" for our local EmComm group on top of this building which will put

our antennas over 150 feet in the air - the highest point in our City and completely out in the clear. At the very least we will

have both a Winlink RMS and a Winmor access point up there and if the budget works out, a remote controlled

HF rig which will certainly give me a much better chance of enjoying my favorite digital modes.

I will continue to watch for VChat stations on 14.073 mh where I do capture a W1 and a W4 from time to time.

By the way, I did a competitive study of the then active digital modes some years ago (published in the (ARRL and TAPR Digital

Communications Conference for 2007) and found that three or four of the three dozen modes I tested stood out against

the rest under the particular evaluation marks I used in the study. As I recall Domino and Olivia were looking quite competitive

at that time.

How do you feel VChat stacks up against modes like CHIPs when bandwidth is an issue and the conditions are lousy (as they

always are with the antennas I have to use for the moment.)

That's because I couldn't hang out in the shack all morning. I called CQ on 7075.0 for a few minutes. Then I had yard work to do, and a few errands to run. Sorry.

I've not had enough successful QSO's using V4 to make a full evaluation. ARQ works fine and as advertised. I got a call from a W4WEB yesterday, the connection came alive, but conditions were suckful so we didn't carry on.

FEC has worked fine in the past here. That was before 1.1.1.1 though, and haven't tried it again since a few weeks ago.

In Navy-Marine Corps MARS we are starting to see Olivia pop up as a good mode for local and regional traffic. Here in SCA, we've been testing it for a couple weeks with mostly good results. The only problems we've had seem to be codec-related, and sometimes between different types of client AP's (MixW and DM780 for example).

I've never used Domino. Would like to give it a spin, but don't see any advertising for its use and don't know anyone local for testing.

Hi Matt,

My problem is the eternal condo antenna limitations problem. My antennas “hidden on the balcony” get out better as the

wavelengths get smaller.

If I were to try my 40 meter hamstick, what forty meter frequency appeals to you? 7,073?

73,

Ed

10136

That's because I couldn't hang out in the
shack all morning. I called CQ on 7075.0 for a few minutes. Then I
had yard work to do, and a few errands to run. Sorry.

I've not
had enough successful QSO's using V4 to make a full evaluation. ARQ
works fine and as advertised. I got a call from a W4WEB yesterday, the
connection came alive, but conditions were suckful so we didn't carry
on.

FEC has worked fine in the past here. That was before 1.1.1.1
though, and haven't tried it again since a few weeks ago.

In
Navy-Marine Corps MARS we are starting to see Olivia pop up as a good mode for
local and regional traffic. Here in SCA, we've been testing it for a
couple weeks with mostly good results. The only problems we've had seem
to be codec-related, and sometimes between different types of client AP's
(MixW and DM780 for example).

I've never used Domino. Would like to
give it a spin, but don't see any advertising for its use and don't know

anyone local for testing.

73,

Matt Zilmer, W6NIA / NNN0UET / NNN0GAF
THREE

Roger. I tried both but did not
see you in either option.

We are in
the process of creating a “radio room” for our local EmComm group on top of
this building which will put
our
antennas over 150 feet in the air – the highest point in our City and
completely out in the clear. At the very least we
will
have both
a Winlink RMS and a Winmor access point up there and if the budget works out,
a remote controlled
HF rig
which will certainly give me a much better chance of enjoying my favorite
digital modes.

I will
continue to watch for VChat stations on 14.073 mh where I do capture a W1 and
a W4 from time to time.

By the
way, I did a competitive study of the then active digital modes some years ago
(published in the (ARRL and TAPR Digital
Communications Conference for 2007)
and found that three or four of the three dozen modes I tested stood out
against
the rest
under the particular evaluation marks I used in the study.
As I recall Domino and Olivia were looking quite competitive
at that
time.

How do you
feel VChat stacks up against modes like CHIPs when bandwidth is an issue and
the conditions are lousy (as they
always are

with the antennas I have to use for the moment.)

That's because I couldn't hang out in the shack all morning. I called CQ on 7075.0 for a few minutes. Then I had yard work to do, and a few errands to run. Sorry.

I've not had enough successful QSO's using V4 to make a full evaluation. ARQ works fine and as advertised. I got a call from a W4WEB yesterday, the connection came alive, but conditions were suckful so we didn't carry on.

FEC has worked fine in the past here. That was before 1.1.1.1 though, and haven't tried it again since a few weeks ago.

In Navy-Marine Corps MARS we are starting to see Olivia pop up as a good mode for local and regional traffic. Here in SCA, we've been testing it for a couple weeks with mostly good results. The only problems we've had seem to be codec-related, and sometimes between different types of client AP's (MixW and DM780 for example).

I've never used Domino. Would like to give it a spin, but don't see any advertising for its use and don't know anyone local for testing.

Roger. I tried both but did not see you in either option.

We are in the process of creating a "radio room" for our local EmComm group on top of this building which will put
our antennas over 150 feet in the air - the highest point in our City and completely out in the clear. At the very least we will
have both a Winlink RMS and a Winmor access point up there and if the budget works out, a remote controlled
HF rig which will certainly give me a much better chance of enjoying my favorite digital modes.

I will continue to watch for VChat stations on 14.073 mh where I do capture a W1 and a W4 from time to time.

By the way, I did a competitive study of the then active digital modes some years ago (published in the (ARRL and TAPR Digital
Communications Conference for 2007) and found that three or four of the three dozen modes I tested stood out against
the rest under the particular evaluation marks I used in the study. As I recall Domino and Olivia were looking quite competitive
at that time.

How do you feel VChat stacks up against modes like CHIPs when bandwidth is an issue and the conditions are lousy (as they
always are with the antennas I have to use for the moment.)

73,

Ed

Subject: RE: [V4Protocol] V4 ARQ QRV now 10136

Roger. I tried both but did not see you in either option.

We are in the process of creating a “radio room” for our local EmComm group on top of this building which will put
our antennas over 150 feet in the air – the highest point in our City and completely out in the clear. At the very least we will
have both a Winlink RMS and a Winmor access point up there and if the budget works out, a remote controlled
HF rig which will certainly give me a much better chance of enjoying my favorite digital modes.

I will continue to watch for VChat stations on 14.073 mh where I do capture a W1 and a W4 from time to time.

By the way, I did a competitive study of the then active digital modes some years ago (published in the (ARRL and TAPR Digital
Communications Conference for 2007) and found that three or four of the three dozen modes I tested stood out against
the rest under the particular evaluation marks I used in the study. As I recall Domino and Olivia were looking quite competitive
at that time.

How do you feel VChat stacks up against modes like CHIPs when bandwidth is an issue and the conditions are lousy (as they
always are with the antennas I have to use for the moment.)

73,

Ed

Hi Matt,

My problem is the eternal condo antenna limitations problem. My antennas “hidden on the balcony” get out better as the
wavelengths get smaller.

If I were to try my 40 meter hamstick, what forty meter frequency appeals to you? 7,073?

73,

Ed

Hi Matt,

I'll be listening on 10136 dial USB this morning. Have a very poor 30 meter antenna – Hamstick, vertical – but if I see you on the screen I will let you know.

1289. RE: [V4Protocol] Re: V4 ARQ QRV now 10136

Yahoo group: V4Protocol
Date: 2011-07-04 16:22:24 UTC
From: Matt Zilmer
Topic: 1232 Message: 1289

Same here. I just installed the full 0.3.0.1 package, available on the Yahoo group Files section. I doubt there is any difference between the TNC 0.3.0.1 "patch" and the newly installed program.

Deme, I copied your connect requests and the program tried to complete the handshake. After a while, your end gave up and there were no more responses.
Seems to be some degree of incompatibility or perhaps levels are wrong at one or more stations. I clearly heard VE7CRT and everything decoded correctly in the TNC.

73,

Matt Zilmer, W6NIA / NNN0UET / NNN0GAF THREE
NMCM RMS Winmor: NNU9ET-5: Upland, CA.

From: Rick Muething
Topic: 1232 Message: 1293

All,

Please remember there are really two programs. The V4Chat and the V4TNC. While now they are currently at the same rev 0.3.0.1 they won't always be so. The V4 TNC will eventually be used by other programs ...it is the virtual TNC and its updates and revisions are separate from the others. The last release did change some minor things in the V4Chat as well. (read the revision history if interested).

If you have a problem it is important to follow this procedure. I will repeat once again for all those that are new:

1) Sync your computer clock to the internet (bring up the clock and click the internet tab) This isn't perfect but it gets you within a few seconds or so. (This allows me to more easily debug two logs one from each end of the connection).
2) Be sure you have the V4 TNC debug log enabled (read the help if you don't know how).
3) When you have a problem not the time as accurately as possible UTC Time is ALWAYS used. Then describe the problem in some words as clearly as possible.
4) Send me the V4 TNC debug.log for the date and indicate briefly what your setup is: "Runnning WIN XP with SP1, 1000 MHz Pentium, 512 Meg Ram, SignaLink USB sound card and TS-480 etc"

Then send the debug log AS AN ATTACHMENT to me: rmuethingATcfl.rr.com. If both ends of a problem connection can send me the log it is MUCH better ...I can see both ends...they are time synchronized and logged to 10 ms.

If you can do this we can make progress... I need to see some things in this last release that have to do with the auto calculation of round trip time that I could not duplicate well with the simulator.

73 and Happy Fourth!

1300. Failed V4 ARQ connection info

Yahoo group: V4Protocol
Date: 2011-07-08 02:16:40 UTC
From: Robert
Topic: 1300 Message: 1300

Hi Rick,

I was calling CQ tonight with V4 Chat version 0.3.0.1 (TNC also 0.3.0.1) on 14.073 and got a connection from NR5G. Seemed like a good clean signal with a clear constellation. The receive window indicated a connection but I never got any received data from him and my xmit window would not transmit anything.

I have emailed the debug log and receive window. Hope this helps.

Robert Wright, N7ZO

Topic: 1300 Message: 1302

No. NR5G connected twice but we were never able to communicate. After that, I did not hear him calling CQ.

Next time this happens I will drop back to FEC mode and try to coordinate a reverse CQ call.

I have never been able to get ARQ mode to work. I thought it was about time to pass some debug info to Rick.

Correction to my last post:

No. NR5G connected twice but we were never able to communicate. After that, I did not hear him calling, CQ or otherwise.

Next time this happens I will drop back to FEC mode and try to coordinate a reverse call. Using a CQ call for this would be ideal, but a targeted callsign call might show the same problem after connection.

1304. New Planned Updates

Yahoo group: V4Protocol
Date: 2011-07-09 13:28:19 UTC
From: Rick Muething
Topic: 1300 Message: 1304

All,
I have just about got all the lost source code recovered and repaired... Damn Virus! I also am working on a new major release that will address several observed problems:

1) Excessive PTT hold ....a critical problem for ARQ modes. Many say “but it works on PSK, Olivia etc” but those are not ARQ Modes. I have a plan to implement a detection of this with the software that will warn users of this excessive PTT hold which has the effect of blocking off the ACKs from the other end. (for example if using a SignaLink or VOX with the Delay set too large). I can’t reduce the PTT hold in software but I can warn of it so you can correct it by settings or by selecting a different PTT keying method.

2) Automatic Round Trip delay (from end of transmit frame to received ACK/NAK sync) calculation and adjustment. There are many factors that affect the timing of the round trip: e.g.
Transmitter Receive to Transmit delay
Sound card latency
RF Transit time
Receiver sound card latency (can be a significant issue on SDR Radios)
OS Latency (Windows was never designed as a true “real time” OS!)
Demodulation/decode time (a function of CPU Speed)
Leader length or VOX delay
The new code will start off each new ARQ session with very generous ARQ timing limits (which of course will reduce throughput) and then based on the actual measured (to within about 20 ms) round trip delay put in a more aggressive (faster throughput) limit for each connection. It will have to have some “pad” to accommodate variances but this should work much better and result in reliable and faster operation without having to have users tweak values.

3) Session Keying of FEC Data, ACK, NAK and IDLs. Currently if there is any other V4 activity (even weak) on or near the frequency it disrupts the protocol by cross contamination of the sessions. This new code creates a fairly unique (8 bit) key that is a function (hash) of the two connected call signs. Unless your ARQ Session has the exact same key (about 1/256 chance) it will ignore those other frames. This keyed sync will slow down the throughput but only by about 2%. Of course since this is not spread spectrum you really can’t expect to have a good QSO with significant interference by other stations but it will drastically reduce the effect casual weak interference will have on the protocol. A larger key could be used but it starts affecting throughput with only very marginal improvement in protection so I picked 8 bits
.
It will probably be a week or two until I get this update finished and enough for beta release.

I have received some useful debug logs from some that point to another problem which I will have to track down. If you happen to have a session with fairly good signals that get hung in some IDL loop when data is queued please send your debug log to me with the approximate UTC time noted (PLEASE, I DON’T HAVE TIME TO WADE THROUGH 1 MByte DEBUG LOGS WITHOUT SOME

CLUE AS TO WHERE THE PROBLEM IS!)
Send the logs directly to me as attachments (rmuethingATcfl.rr.com)

Thanks for your continued support and feedback.

73,
Rick KN6KB

All,
I have just about got all the lost source code recovered and repaired... Damn Virus! I also am working on a new major release that will address several observed problems:

<SNIP> <SNIP>

>3) Session Keying of FEC Data, ACK, NAK and IDLs. Currently if there is
>any other V4 activity (even weak) on or near the frequency it disrupts the
>protocol by cross contamination of the sessions.

This is why I asked here on 24 June:
~~~~~~
I don't think I ever expected V4 to handle more than one ARQ connection
at a time. But can V4 handle multiple ACKs on a busy frequency arising
from many different (unrelated) connections, ignoring all ACKs other
than the one it expects to hear at any given time?

Or is it possible for V4 to erroneously respond to an ACK belonging to
another (unrelated) connection?
~~~~~~

>This new code creates a
>fairly unique (8 bit) key that is a function (hash) of the two connected call
>signs. Unless your ARQ Session has the exact same key (about 1/256
>chance) it will ignore those other frames. This keyed sync will slow down
>the throughput but only by about 2%. Of course since this is not spread
>spectrum you really can’t expect to have a good QSO with significant
>interference by other stations but it will drastically reduce the effect casual
>weak interference will have on the protocol. A larger key could be used
>but it starts affecting throughput with only very marginal improvement in
>protection so I picked 8 bits

This is a good step in the right direction, but another question: how
does/will V4 handle missing/duplicate frames?

Ian,
The Session Keying of the Syncs just reduces the susceptibility to non connected ARQ or FEC session. The trick is to insure the sync key is ignored in decoding the first connect request since the target station doesn't yet know the sync key. I have a scheme for that because the sync key is contain in the CRC of the connect request frame which is only decoded if you are not already connected.

Not sure I follow your question on missing or duplicate frames. Maybe this answers your question.

1) If the ISS sends a frame and it is not ACKed (actually if the ISS does not receive and decode the ACK from the IRS confirming reception by the IRS) it simple repeats the frame until it is ACKed or the link times out. So you can't get a missing frame unless of course the link drops out (typically 90 seconds of no ACKs). Any ACKs received by the ISS that don't match the session ID key are ignored.

2) If the ISS sends a frame and it is received and ACKed by the IRS but the ISS misses the ACK it repeats the frame. But since the IRS keeps an exact copy of the last frame ACKed and passed to the application it compares every received frame to the last ACKed frame. If it is a duplicate frame the IRS will ACK again but NOT pass the duplicate data to the application. This isn't quite bulletproof (what if you really wanted to send to exactly the same 16 character frames sequentially?) but this is very unlikely under normal text conditions unless you are sending say a very long string of the same characters. In WINMOR where you are transmitting exact binary data using multiple carriers each packet carries an 8 bit packet sequence number but that would be more overhead in V4 which is probably not really needed. If it turns out in testing we really feel each frame needs a sequence number it could be added at some expense of throughput.

The real challenge is incorporating some of these features without loading up the overhead which kills the throughput. The keyed sync system I came up with only added 2 symbols per frame (~42 ms)... less than 2%. It will be interesting to see how that works in practice.

Sounds good.

>Not sure I follow your question on missing or duplicate frames. Maybe
>this answers your question.

[Snip Rick's answer]

That also sounds good. My main concern was what happens if the original
data was indeed repeated in more than one frame, and how would the
receiving end recognize this without frame sequence numbering. In binary
transfers this is a real possibility, but in a keyboard chat situation
this is unlikely to be an issue.

However, it is my understanding that you will be offering the modem as a
candidate for inclusion in other people's packages. I think you will
need to make it clear that the modem will be unsuitable for reliable
binary transfer, because of the lack of frame sequence numbering.

>
>The real challenge is incorporating some of these features without

Agreed.

>It will be interesting to see how that works in practice.

I'm looking forward to trying it!

Hello rick, althoug I cant participate in the US, european testing. I am testing the software overhere in ecuador in a 1 hop mode at about 500km. I would like to ask, you adressed already, if it is possible to delay the TX/TX timing by software, so radios with a slow AGC will have a possibility to synchronize. I have several radios with a fixed ACG. Te other way would be changing the hardware to make the AGC faster.
Greetings

Ian,

V4 is not intended for binary transfer. There is already a good and much faster sound card protocol called WINMOR (500 Hz or 1600 Hz BW) that is designed and optimized for binary transfer (including compressed text). V4 is designed and optimized for fairly quick turnaround keyboard sessions using plain text (ASCII or UTF-8 encoding). The only reason one would use V4 for binary transfer is to force the connection into a 200 Hz bandwidth. Better throughput would almost always be achieved using WINMOR and WINMOR has a gear (modulation) shifting mode that dynamically adapts to the channel conditions.

From: Rick Muething
Topic: 1300 Message: 1311

The next beta release will have a mechanism in that automatically measures what I call T>R Latency. That is the delay from the programs release of the PTT line to the first detection of received audio. I am testing this now and for example with my SignaLink USB and TS480 (The SignaLInk releases the PTT when there is no audio being “played” similar to VOX) The measured T>R Latency is about 120 ms with the SignaLink delay set to minimum. That 120 ms is the sum of several components including some latency in the OS and sound card. This really should not have anything to do with AGC timing as most receives come back to receive rapidly regardless of AGC speed. (The AGC speed will of course slow down the response to an over load signal but that should occur only if you are actually monitoring your own transmitter. On my setup I get virtually the same T>R Latency measurement with AGC set to Fast or Slow.

The new release will also include an automatic measurement and auto adjustment of the round trip time (Release of PTT until ACK sync detected). This permits optimizing the timing (including necessary guardbands) based on actual measured values ...which could be unique for each session. This will help with operation using VOX or with SDR Radios.

However if you want to universally be able to operate with very large T>R Latency (say > 300 ms) you would have to impose a large guard band on EVERY connection as this cannot be removed or compensated automatically by the software. Keep in mind most modern transceivers have T>R switching times of < 50 ms. Pactor for example requires T>R switching times < 50 ms.

Ed,
If you are showing that much ALC you probably have RF feedback into the audio. The Power out ought to be able to be pushed up to about 70 Watts before ANY significant ALC shows on most radios. (Icom's are different ...they always show some ALC). The Power output level also ought to decrease slowly with drive if it jumps around or "falls off the cliff" there is some feedback. None of this has anything to do with V4 or WINMOR...its just basic sound card operation with RF. Suggestions:

1) Always drive the sound card interface into the AUX input...its usually far less sensitive than the Mike input. Use the lowest sensitivity on the aux audio and the highest output level of the sound card interface possible.
2) Use ferrite clamp on chokes on all cables (audio in/out and control)
3) Use a line isolator in the coax from the radio/tuner to the antenna.
4) use a balanced antenna or a good tuner with solid ground. RF in the "shack" will get into the sound card interface.

The help file in V4 shows some sources for the clamp on chokes and Line isolators.

There is rarely one silver bullet...what you are after is 3 or 4 things that each give 5-10 dB improvement or so. Most sound card interfaces are actually pretty poor when it comes to RF isolation and filtering. If you have ever looked into a PTC II you get a feeling for the care and attention they put on RF filtering and isolation....There is a good reason for that especially in modes that use complex waveforms.

1317. Re: [V4Protocol] Re: New Planned Updates

Yahoo group: V4Protocol
Date: 2011-07-12 18:52:35 UTC
From: Rick Muething
Topic: 1300 Message: 1317

Finn,

I am making good headway on the round trip correction in V4 and also in measuring the Transmit>Receive switchover time. Those two things can be applied fairly easily to WINMOR.

Here is the problem with trying to automatically handle WINMOR via a repeater.

1) Without a repeater the typical round trip delay (from release of PTT until the returned ACK is detected) is on the order of maybe 400-600 ms. So you could fairly safely put the initial repeat interval (the interval between repeats if an ACK or NAK is mised) at say 1000 ms. Then you could safely adjust that down to something just above (say 100 ms or so above) the actual MEASURED round trip delay. That adjustment optimizes the throughput as a function of the connected station timing.

BUT

2) If you are using a repeater the round trip delay may be say 2-3 seconds. So your initial connection has to start off with a repeat interval of at least that amount (Otherwise you'll be repeating during the received ACK so you would miss it). That adds a lot of time to a connect request which is already slow enough.

The only practical thing you could do is put a flag in the INI file that would set the initial repeat interval very long and live with the slow connect sequence and resulting lower throughput. After the initial ACK is received the repeat interval could be reduced but it would probably have to have some substantial margin over the measured round trip since there is some additional uncertainty going through each repeater.

But the basic problem is operating an ARQ mode through a repeater is VERY inefficient and begs to use very long data cycles to try and recover the throughput. The issue I have is it is just not good engineering trying to spend lots of time and energy trying to fit the square peg in the round hole. In the end the best solution is to engineer the solution correctly from the beginning.

Rick

1318. Re: [V4Protocol] Re: New Planned Updates

Yahoo group: V4Protocol

From: Lyle Johnson
Topic: 1300 Message: 1318

When we developed the TAPR TNC, we added two timing parameters: AXDELAY and AXHANG as I recall. AXDELAY would add a specified delay time to keyup flags-before-data to allow a voice repeater to key up and settle.

As long as subsequent exchanges never exceeded AXHANG from the tail of one to the head of the next, AXDELAY would not be inserted. This way, the additional delay to bring up the repeater was not used unless the repeater had timed out (exceeded AXHANG).

Of course, in those days, we didn't use CTCSS and other delaying things...

1319. Re: New Planned Updates

Yahoo group: V4Protocol
Date: 2011-07-13 17:38:54 UTC
From: la7um
Topic: 1300 Message: 1319

Hi Rick and Lyle. I absolutely see your point of view Rick. You earlier mentioned some asyncron mode with strong fec...I wonder some future RPR alike....

RPR is only 500Hz, asyncron, but maybe not "fec enough" as WINMOR 1600Hz and uneccessary narrow. but the way RPR changes to "extremely long bursts" when first running make my mind twist my brain like the Apollo 13 way of connecting a circular tube into a square hole (according to the movie only).

Winmor, as you know I have proved and posted, works very well running through a NFM Voice repeater. And off course, by longer bursts, the loss of throughput by all the switchings is partly compensated by the longer bursts. Throughput for now falling to abt 6 KB/Min when good signals and one repeater. 2-3 KB/min when addedd a 6m to 70cm Xband repeater in the chain without CTCSS. It stumbles from time to time off course because of non proportional timeouts and not intended to, but still works.

Response delay 1000 (default 100) and leader extension 10, default 0 on server and client through only ONE repeater.

Client ALONE needed increasing leader extension to 23 for also stumbling through the x-band addon into the repeater set in carrier inn = carrier out mode.

That WINMOR 1600Hz mode 2-3 KB/Min still might be pretty much quicker than through a congested multipath 80m during night time. And other more distant stations might need the HF frequences as well.

In areas where infrastructure is devastated, I would think that the very first of priority would be rebuilding a VOICE repeater, and maybe suitable for chaining a X band rpt CTCSS may be a tool, before doing any Packet extra installations.

And only from time to time some digital mail might be needed.

Since you at various occations have mentioned some "philosofical thoughts about a mode more optimized for FM (NFM) then WINMOR OF TODAY is, a new mode maybe might work with longer bursts.

Maybe by integrating results from switching measurements in V4 development and achievements from various fields, developing of V4 slowly may create a spinn off into some future new useful animal for everybody.

Sorry for being Off Topic here, but getting inspired.

1320. Pending V4 Chat release 0.4.0.0

Yahoo group: V4Protocol
Date: 2011-07-19 11:28:00 UTC
From: Rick Muething
Topic: 704 Message: 1320

All,
I have been working a lot on the latest update that should solve a number of observed problems. It still needs more testing on the simulator before beta release but I hope to have it out by the end of the week. It will require EVERYONE switch over as there is a compatibility issue with the current version.
Significant changes:
1) Data, ACK, NAK, and IDL frame keying to a specific ARQ Connection (dramatically reducing the chance of a non connected station/QSO contaminating a connected session.
2) Disconnect sequence to cleanly end a connected session.
3) Improved framing and frame tracking algorithm to accommodate framing errors and sample rate errors up to .2% (2000 ppm.... a pretty large sample rate error)
4) More reliable link changeover IRS>ISS and ISS>IRS.
5) Automatic measurement of your stations PTT Hold latency. (The time the program commands PTT release until it sees first received audio). This will help find and allow fixing of installations with excessive PTT hold or Sound card latency (e.g. slow keying or improper SDR settings).
6) Automatic measurement and optimization of Link timing. Upon initialization the reply time (time from End of data frame to ACK received) is measured and used to optimize link timing. This allow for a longer (more forgiving) initial value but a shorter (maximum throughput) value after automatic optimization. The measured response time in ms is logged. This (along with recovering from a back rev of source required due to to a virus) required a lot of code changes and Help changes. I should be able to get these all cleaned up and tested by the end of the week.
73,
Rick KN6KB

Looks good,
Summer vacation here, 2nd day of 5 weeks!

I'm located now in KP42en and going soon to Lapland, there in mr. Santa Claus Land I will load v. 4.0.0.0 and be QRV in loc KP36cp by solar powered 180 Ah battery.
I can run 100W to dipole there

Yussy. I wonder if you'll manage LA3F-5 on WINMOR from Lapland as well.
That would have been nice on 80m. I remote "see" you running now from KP20IE. You probably need goin 20m to Marc in Holland I presume.

1326. New Beta Version of V4 Chat 0.4.0.0 uploaded to Yahoo FTP.

Yahoo group: V4Protocol
Date: 2011-07-21 12:12:01 UTC
From: kn6kb
Topic: 1326 Message: 1326

All.

I have updloaded the latest test release of V4 Chat and V4 TNC. This has extensive changes some making it incompatible with prior versions so all should download this version. I have done some extensive testing but with the magnitude of the changes there are likely some latent bugs.

You will have to uninstall the current V4 Chat and then download and unzip the install file. No settings will be lost.(ini file is left intact).

Significant Changes:
1) Data, ACK, NAK, and IDL frames now "keyed" to a connected session (call sign pair). The should dramatically reduce chance of cross session contamination.
2) Rework of IRS<>ISS change over with state table change.
3) Addition of automatic R>T Latency measurement
4) Addition of automatic ARQ cycle timing based on round trip measurement each session
5) Addition of END function for clean and fast ARQ session End.
6) Rollback leader detection to Rev 0.1.7.4
7) Implement reduced tuning range when ARQ connected.
8) Implement auto CW ID upon ARQ session end if CW ID enabled.
9) Improved Symbol framing using phase measurement of leader
10)Expanded stat collection of ARQ sessions when debug log enabled
11) Updated V4TNC Help and V4 Chat help.

Please be certain to read the Help section on T>R Latency. There has been major updates to the help ...please read!

If you have problems be sure to follow the standard procedure:
Enable debug logging
Note the approximate UTC time the problem was observed
Explain the problem as best you can
Send me the V4 TNC debug log as an attachment. Both ends of the session if possible.

Good Luck.

Rick KN6KB

Up and running with the new version this morning. My measured T>R latency: 47 ms

Saw and called WB2LOU, K8LEN and KC3OL who were calling CQ in ARQ mode on 14.073.00 between 13:00 and 14:20 UTC but no connects.
I did see K8LEN calling me, but there was no connection.

Thanks Russ... Interested in knowing your hardware configuration that goes along with that relatively fast Latency measurement. Ted got between 225 and 250 ms with an SDR and VAC but was able to bring that down under 200 by tweaking the VAC buffer parameters.

If you could read the “*** Connect Request YourCall de Callers Call” in the Session window that means it correctly decoded the connect request frame and that should establish the connection (if you are ARQ mode of course ... In FEC mode there is no connection of course). Your end should start ACKing with each received Connect Request or IDL frame. Of course if the other side misses your ACKs the link will timeout quickly. (I have the call now limited to 30 seconds).

73,

Rick KN6KB

Rick,

My radio is a Yaesu FT-840. The Computer is a home assembled one with a 2.80 Ghz CPU. The interface is a simple transistor circuit that I put together quite some years back that keys the PTT line on the FT-840. Hope this helps..

Rick

Did have a bit of a problem staying connected this afternoon. My computer was not returning the ack signal that I was receiving from the other station and would of course time out. On other occasion it would just drop the link with the other station. It appeared to be a quality signal, but with some QSB and QRM.

Attached is the DEBUG log. Set up is ASUS mother board, 2.4 chip, 1.24gig of RAM, 80 gig hard drive, XP SP3.

Many thanks for the upgrade, despite this, it looks to be a winner.

Topic: 1339 Message: 1339

IN my setup screen the DATA PORT is greyed out. Should it be? and if not how do I correct it? The TNC port is 8510. Even though I have been able to connect to either a CQ or answering a CQ stations, that's all that happens. When in ISS mode none of my typing, after keying CTRL/ENTER , goes into the buffer and then the connection times out.Do I need to submit the logs? I have read the help files and haven't found an answer.

Thanks in advance, 73, John KJ1J

Ed,
As described in the help the data port is ALWAYS one above the Control port. Its grayed out because you can’t set it. You can select the control port which in turn sets the data port to the next sequential port. It’s all there in the help.

I am doing some additional updates....that may address the details of you problem but in general when you tell me something is broken and don’t supply me any debug log files and point me to where (UTC Time) you observed the problem it is most often a waste of time. Read the help section on logs for the best way to use the logs...it works and it is the only way I can get detail. In programming as in life the devil is in the details!

1343. First test on 80m

Yahoo group: V4Protocol
Date: 2011-07-23 06:02:17 UTC
From: oh5rm
Topic: 1343 Message: 1343

Yesterday evening tested with OH7JJT.
Made the following remarks:
- When calling ARQ CQ, five transmissions were made, then display
*** Calling CQ de OH5RM
*** DISCONNECTED ARQ Timeout... Outbound buffer purged.
*** Sending CWID DE OH5RM.

I think no CWID was sent. After abt. 10sec TX was forced to transmit, but no audio. This transmit last for ever unles you use "Abort" which then stops tx-on and sends CWID. Maybe there is something wrong in FT817 command string. PTT ON CMD=08, PTT OFF CMD=88

The other problem was the BUSY indicator which for the most was on red so preventing the answer to calling station on otherwise clear channel.
Is there any way to inactivate the detector? I tried to vary the sensivity but no help.

73 Jouko OH5RM

This mirrors exactly what I have seen with my FT897. I first (Thursday) had problems which were of my own making and thought perhaps I had not got everything restored properly after much fiddling, but now I will send my log in as it is certainly not right. The CWID is visible on the waterfall but the TX is not keyed when it is sent but TX is keyed AFTER the tones stop so behaving as if the TX key logic is inverted when CWID is invoked. I will do one quick test with CWID disabled before I send my logs in. TX keying is by CAT control.

I believe Rick is aware of the CWID and keying issues. You should send him your logs and note what the UTC time was you had the problem.

As described in the Help user files can be used on either FEC or ARQ modes. However they are not active in ARQ mode until AFTER a connection is established. In ARQ mode you can’t transmit any data until you are “Connected” as per the mechanism described in the help.

1351. New Beta release V4 Chat 0.4.1.0

Yahoo group: V4Protocol
Date: 2011-07-24 14:02:51 UTC
From: kn6kb
Topic: 1351 Message: 1351

All,

I have just uploaded a new release that should fix all or at least most of the reported problems with 0.4.0.0

This release is compatible with 0.4.0.0 but has fixes that are important. In addition there is now the addition of an optional internal 400 Hz wide filter which can be switched in on the TNC menu. I have not had much on the air testing with this but you can try and see if it helps decoding under some conditions (noise or strong local interference in the audio pass band).

You must uninstall the current V4 Chat. Then unzip the release and install the new version. No settings will be lost.

I will try and listen on 14073.0 USB Dial this afternoon and try and work some stations if possible.

73 and good luck,

Rick KN6KB

Summary of revisions from 0.4.0.0:

V4 Chat Revision History

Date: Rev Change Summary

July 24, 2011 0.4.1.0 Beta release of 0.4.0.1 (no changes to 0.4.0.1)

July 24, 2011 0.4.0.1 Cosmetic changes on Radio Control frame
V4 Chat Help updated.

V4 TNC Revision History

Date Rev # Summary ofChanges

July 24, 2011 0.4.1.0 Beta Release of 0.4.0.1 (no changes to 0.4.0.1)

July 24, 2011 0.4.0.1 Remove if PTT=false condition on PlaySoundStream (may affect PTT on CWID)
Add SetPlaybackState to TransmitFEC for TwoToneTest.
Add exception logging and recovery in GoertzelTDReal
Add exception logging and recovery in GoertzelRealImag
Change Amplitude of ACK/NAK/IDL frames to full Two-Tone Peak
Rework logic of ProcessACKs and ProcessIDLs to clean up IRS<>ISS transitions
V4 TNC Help Updated
Increase trip threshold for BusyDetector wide band (a function of Squelch)
Modify noise contribution to average 3 terms instead of 4.
Modify SearchForLeaderTone envelope calc and to always do two-tone search

```
Modify ThreshDetect to require two sequential Correllations above the threshold
Add BPFilter (~400 Hz) which can be switchen in/out
Add update of LastGoodDecode except for IDLs to avoid premature timeout
```

QRV 2011/07/24 23:25 14.073

A few minor issues as of 0.4.0.0

1. CW ID does not work after timeout or abort request. OK in manual mode.

2. "Paste" and "Paste and Send" do not appear to work

No qso's so far using 0.4.1.0 but decoded 3 stations using 400 Hz filter: EA3AQS, W4WEB, G3WKW

QRV 2011/07/24 23:25 14.073

A few minor issues as of 0.4.0.0

1. CW ID does not work after timeout or abort request. OK in manual mode.

2. "Paste" and "Paste and Send" do not appear to work

No qso's so far using 0.4.1.0 but decoded 3 stations using 400 Hz filter: EA3AQS, W4WEB, G3WKW

From: Bob Thornton
Topic: 1351 Message: 1356

We did appear to "Connect" on 2 occasions but no traffic passed and not even a NACK. I remained in IRS until timeout. I do think the signal was probably too poor for a satisfactory QSO but would have expected some attempts and failed frames at least.
I also heard EA3AQS call CQ but I believe he was in FEC mode only.

I will send Rick the log with the times of our "connections" noted as both ends may be useful.

Hi Rick and V4'ers,

Had my 1st QSO on V4 with Ray, KB0E, good 599 signal this morning. I have to get use to arq mode
waiting for a turnover. When I hit (Cntl + Return), I'm of the old school and expect immediate transfer.
A sign of old age I guess Hi Hi. It worked fine Rick just have to get use to arq.

73 & GL,
Fred, W1WYC

A work-around is to disable the automatic CWID in the Radio Setup menu and then send it manually from the TNC as required. I found that the tones were sent on the audio line but the TX Key was not sent until AFTER the tones had been sent. I was then stuck on TX until I ABORTed.

Very interesting - I have the new version 0.4.1.0 on my notebook using Vista and the SignLink USB soundcard/interface - which does indeed send the CW ID after calling CQ... BUT, the same version installed on my desktop running XP Home, using the Creative Extigy external soundcard with COM 1 as the PTT, does NOT send the ID following a CQ. Go figure.

Should have said that mine is Windows XP with CAT control of the FT897. I tried VOX control as a work around but that was not workable in my case. (Also I hate the way it keys the TX when the computer boots up, always surprises me!!)

1367. Report from VK

Yahoo group: V4Protocol
Date: 2011-07-26 00:04:59 UTC
From: Paul Whitaker
Topic: 1351 Message: 1367

Hi Rick & Group,
V4Chat 0.4.1.0, IC706, homemade interface with CAT.
Contact with VK5PO - 680km on 80mtr. Very noisy QRN conditions.

Some difficulty at first, but we found that setting the RX audio level lower - low in green, helped a lot.
We then got into the idea of waiting for the short regular handshakes before Ctrl/Enter the new text to send.
We then had about 15 overs with 100% accurate copy - with no extraneous garbage. Very pleasing to see.
Rick, all we need now is a TYPING TUTOR !

Well done.

We are also experiencing the CWID problem, but hey - thats the least of it !
Is there any indication when there are repeated frames ? (its good to see the progress, and why its taking longer)

I have been monitoring 14073 in the hope of hearing some of you Sataeside - sent plenty of long FEC CQ's, but nothing yet.
Also monitoring 3635 in the evenings for local traffic.

The group is obviously growing - is there any way of seeing a list of stations / locations to help in finding contacts ?
Also, frequencies that you use..... (14073 ? - others ?) I am trying to get our group to all STAY on the one frequency each band - (its a big world out there !)

Thanks guys - very interesting watching your posts.

From: K6KAR
Topic: 1351 Message: 1369

With ARQ, I wish that I could say the same but still, no joy here. Using a Flex-5000A and VAC, I've got latency down to around 180ms. I do get a connect but that's as far as it goes. I realize that my comment without the debug log does not provide any useful information. I've set VAC and the Flex-5000A to the settings that work for WINMOR/RMS which by the way I have no problem. As V4 updates are generated, I'll keep testing but nonetheless, it sure is frustrating. Never have had, with any V4 beta release, a successful ARQ, QSO.

Paul,

I'm getting around 180 ms. I've made many software tweaks to get latency to this level. However, latency could be the source of my problem. I use virtual audio cables and virtual com ports. The virtual com port program controls PTT. This is the nature of using a software defined radio. Other than a 1394A interconnect to my computer, I use no hard wired cabling as all interconnects are accomplished via the virtual cables. The only mode I have problems with and this is only ARQ is V4. All other third party digital programs interconnect and work well.

73,

Kirk, K6KAR

Hi Kirk, John and group,
Just a comment - the T>R Latency I am getting averages around 47 to 62 ms. Wonder what you are getting John ? What is your PTT method ?

Cheers,

Paul Whitaker.

With ARQ, I wish that I could say the same but still, no joy here. Using a Flex-5000A and VAC, I've got latency down to around 180ms. I do get a connect but that's as far as it goes. I realize that my comment without the debug log does not provide any useful information. I've set VAC and the Flex-5000A to the settings that work for WINMOR/RMS which by the way I have no problem. As V4 updates are generated, I'll keep testing but nonetheless, it sure is frustrating. Never have had, with any V4 beta release, a successful ARQ, QSO.

To add further to Pauls comments, We only used ARQ, so good to see this mode is usable in the latest version of V4 Chat.
73, De John, VK5PO

Hi Rick & Group, V4Chat 0.4.1.0, IC706, homemade interface with CAT. Contact with VK5PO - 680km on 80mtr. Very noisy QRN conditions. Some difficulty at first, but we found that setting the RX audio level lower - low in green, helped a lot. We then got into the idea of waiting for the short regular handshakes before Ctrl/Enter the new text to send. We then had about 15 overs with 100% accurate copy - with no extraneous garbage. Very pleasing to see. Rick, all we need now is a TYPING TUTOR ! Well done. We are also experiencing the CWID problem, but hey - thats the least of it ! Is there any indication when there are repeated frames ? (its good to see the progress, and why its taking longer) I have been monitoring 14073 in the hope of hearing some of you Sataeside - sent plenty of long FEC CQ's, but nothing yet. Also monitoring 3635 in the evenings for local traffic. The group is obviously growing - is there any way of seeing a list of stations / locations to help in finding contacts ? Also, frequencies that you use..... (14073 ? - others ?) I am trying to get our group to all STAY on the one frequency each band - (its a big world out there !) Thanks guys - very interesting watching your posts. '73 Pa

From: POB
Topic: 1375 Message: 1375

On the soundcard it shows v4 mode-ARQ <DISCONNECTED> although I am in the ARQ mode, is this right or is there something to do in the setup....
POB/K8LEN

From: Bob Thornton
Topic: 1375 Message: 1376

That is correct. You are not connected until another station calls
you, or you call them and they respond to you.

Bob

1377. Question on ver 0.4.1.0

Yahoo group: V4Protocol
Date: 2011-07-26 20:12:37 UTC
From: David Boland
Topic: 1375 Message: 1377

I downloaded the newest version 0.4.1.0 and tried it today in a net situation. Everyone copies me but I copy no one. We are using FEC HD mode so that we could copy and sent to everyone on the net. I can see in the waterfall that someone is transmitting but I get nothing in the constelation screen. not sure what I need to change.

Two weeks ago we ran the same type of net and copied everyone using ver 0.4.0.0
persons may contact me here or w9nwy@...

From: Rick Muething
Topic: 1351 Message: 1378

Kirk/All,

There should be no need to get the latency down below 200 ms. There is a built in delay in the program to delay a response (e.g. an ACK/NAK or IDL) by 300 ms. So if your Latency as measured by the program is < 250 or so there should be no problem. The program measures (to about 20 ms resolution) the time from its command for PTT release until first audio is observed from the receiver. That is the time your receiver is “deaf” due to T>R switching delay and sound card latency.

The program also measures the round trip delay (ISS PTT Release until ACK is received by the ISS) and uses that value to set the repeat intervals. This is done at the beginning of each connection and logged into the debug log. That value is typically between 500 and 1000 ms and a function of several things on EACH end along with 2 x the transit delay.

Topic: 1381 Message: 1381

have just completed (all failures in ARQ before) my very first qso with the latest version.

question is how does one know where in the tx text you are sending that the other end has received.

ie. a long text with may repeats...how do i know what he has gotten so far ?

Relevant thought. Running Pactor 15 years ago in terminal mode on a KAM you could choose if you wanted the type of Echo actually showing LIVE while getting through.

Maybe such a choice could be of value and of practical use while using a split screen. Typing on the lower screen, what is getting through slowly appearing on the upper screen.

Yes there can be more done....Right now (0.4.1.0) you have an outbound Queue indicator (far upper right of the V4 TNC form) that tells how many bytes are left to be ACKed. That number counts down with each ACKed transmitted frame in ARQ mode (or with each from sent in FEC mode) . When you add more text from the keyboard text box it increments back up. The value shown is always the data still pending to be sent.

Certainly fancier techniques to show the sent text can be done. Its “just a small matter of programming” to for example change the blue italic text in the Session window to something like purple italic or something AS each block that is queued is ACKed. Actually it is not trivial coding but it can be done. But FAR MORE important than this however are more difficult tasks like:
1) Making the protocol itself bulletproof
2) Optimizing the DSP for weak signal decoding and tracking marginal sound card hardware.
3) Optimizing the protocol net throughput to accommodate the wide variety of user configurations yet be automatic so as to not require the user to enter several timing parameters etc.

For the protocol to be accepted it first has to work...then we’ll worry about the nice “fluff” on the user interface. Hopefully there will be other developers that want to use the V4 TNC and put on their own GUI.

I had an excellent contact with 9Z4BM on 14073. Perfect copy without any problems. Everything worked as described in the Help file.

Here is his web site: http://9z4bm.tripod.com/

FYI I paste several brag files into the text box using FEC mode and then switch to ARQ mode. My 87 year old fingers need all the help they can get

Kirk, K6KAR I am sorry for the delayed response.
**
It turns out that I am having a terrible time with my Flex 3000. I upgraded to PowerSDR version 2.1.5. I lost all of my settings and now even as I rebuild them I find that there is a crackling, popping nose in the audio and I believe the RF modulation is distorted especially in digi modes.

I am going back to version 2.0.22 which was perfect for me, but have to rebuild the database I forgot to save !!

I am sure you have done this, but in case you have not, check the WINMOR Help and read the section dealing with Flex radios. Follow those guidelines and your latency will start to go lower. I found if the latency is less than 200 ms everything is OK. I set the Digi buffers to 512 and the sampling rates to the max number provided in the selections.

From: K6KAR
Topic: 1351 Message: 1388

Ted,

Appreciate your advice but using the Flex WINMOR settings is the first thing I did. As I previously mentioned, my latency is down to around 185ms. Rick mentioned in an email that this is well within the V4 design parameters.

With regard to you having trouble with PowerSDR version 2.1.5: I suggest you use Safe Mode 1 or 2. Another area to look at is your buffer settings. You may need to increase these. I also have a 3000 and have no problem with PWSDR vs 2.1.5 As you are probably aware, these settings are really interdependent upon the capability of your computer.

73,

Kirk, K6KAR

Kirk what SDR do you have?. I run the Flex3000 and I have the latency down to about 120ms. If you have a Flex I can send you my settings for you to test and tweak

Ted, WB2LOU

On Tue, Jul 26, 2011 at 7:54 AM, K6KAR <kirk.harding@...> wrote:

Paul,

I'm getting around 180 ms. I've made many software tweaks to get latency to this level. However, latency could be the source of my problem. I use virtual audio cables and virtual com ports. The virtual com port program controls PTT. This is the nature of using a software defined radio. Other than a 1394A interconnect to my computer, I use no hard wired cabling as all interconnects are accomplished via the virtual cables. The only mode I have problems with and this is only ARQ is V4. All other third party digital programs interconnect and work well.

At 08:28 PM 26/07/2011, you wrote:

With ARQ, I wish that I could say the same but still, no joy here. Using a Flex-5000A and VAC, I've got latency down to around 180ms. I do get a connect but that's as far as it goes. I realize that my comment without the debug log does not provide any useful information. I've set VAC and the Flex-5000A to the settings that work for WINMOR/RMS which by the way I have no problem. As V4 updates are generated, I'll keep testing but nonetheless,

it sure is frustrating. Never have had, with any V4 beta release, a successful ARQ, QSO.

To add further to Pauls comments, We only used ARQ, so good to see this mode is usable in the latest version of V4 Chat.
73, De John, VK5PO

Hi Rick & Group, V4Chat 0.4.1.0, IC706, homemade interface with CAT. Contact with VK5PO - 680km on 80mtr. Very noisy QRN conditions. Some difficulty at first, but we found that setting the RX audio level lower - low in green, helped a lot. We then got into the idea of waiting for the short regular handshakes before Ctrl/Enter the new text to send. We then had about 15 overs with 100% accurate copy - with no extraneous garbage. Very pleasing to see. Rick, all we need now is a TYPING TUTOR ! Well done. We are also experiencing the CWID problem, but hey - thats the least of it ! Is there any indication when there are repeated frames ? (its good to see the progress, and why its taking longer) I have been monitoring 14073 in the hope of hearing some of you Sataeside - sent plenty of long FEC CQ's, but nothing yet. Also monitoring 3635 in the evenings for local traffic. The group is obviously growing - is there any way of seeing a list of stations / locations to help in finding contacts ? Also, frequencies that you use..... (14073 ? - others ?) I am trying to get our group to all STAY on the one frequency each band - (its a big world out there !) Thanks guys - very interesting watching your posts. '73 Pa

From: jhhaynes@earthlink.net
Topic: 1389 Message: 1389

I have the send CW ID box checked, and it says it is
sending the CW ID, but I don't hear it going out.

If I punch the SEND CW ID button on the TNC window
it does send a CW ID.

Jim,
As most always the case I can’t do much with that word description. Enable the debug log. Clear out the old debug log. Try and re create the problem. Send me the log as an attachment noting the problem observed and the approximate UTC time. There are close to 100,000 lines of code in this ...bugs are only fixed with details.

Hi Leon,

It was great connecting with you today. Like you said conditions were not good. There must have been a lot of of retries because it took a long time to send a small amount of data. But I was able to copy your data until we timed out. It looks like the software is working great.

From: DAVID
Topic: 1393 Message: 1393

i have v4 installed on two machines/rigs.
xp/sp3 and win7/64.

i see that the rx level bar graph on the xp machine is segmented like it
has real led's in it.
the win7 machine has the rx bar graph indicator is solid.

doesn't seem to make a diff, just curious about it.

David,
The program is not compiled for a specific OS. Different OS have different “styles” and those can also be sometimes customized by the user. The level indicator (a progress bar) does sometimes appear different on different Windows versions.

1397. V4 Chat 0.4.2.0 Uploaded to FTP

Yahoo group: V4Protocol
Date: 2011-07-28 14:19:37 UTC
From: kn6kb
Topic: 1397 Message: 1397

All,
This release should take care of several reported problems. Uninstall your previoous version if any, download and unzip the above from the files section and Run the setup. No prior settings will be lost. I am particularly interested if you have a proble with either:
1) T>R Latency measurements or inability to get the value < 250 ms
2) CW ID keying. There have been changes made and additional logging added but I could not get this to fail on my systems using all 4 PTT keying mechanisms. If you still have a failure send all the logs (V4Chat and V4TNC.debug log. along with your configuration.

This also fixes a couple of seldom but serious run time errors that were reported.

This version is compatible with all o.4.x.x but for best results all should upgrade to this new version.

Good Luck.

Rick KN6KB

I Just had a “QSO” on 20M with someone using version 0.4.2.0. He was obviously not familiar with how V4 and V4 Chat works. Though he wasn’t strong I could copy them well. I could watch my outbound text queue count down to 0 (that is my confirmation that he is receiving) but he never grabbed the link back after my typing (always ending with BTU or K). We tried 3 times but I don’t think he knew how to send data. Remember it is called V4 :”Chat” for a reason! It should work just like a conversation and the protocol should be interlocked to make sure both can’t “Send data” at the same time. I know I am not the best help writer in the world but it does have information that is important and it is reasonably current. If you’re not sure how it works please read the section on ARQ sessions in the V4 Chat help.

John,
In software there is almost always a “Way”. But docking windows is not trivial and I consider it a GUI frill. That means it gets put at the end of the TO-DO list behind things like:
Protocol bugs
CW ID bugs
Sensitivity tweaks etc.

Those things that HAVE to be fixed to make the protocol bulletproof and usable are always first on the list!

What is probably easier and as useful (most people don’t understand docking) is to just remember the offset of the Call window from the main window (X, Y) and repeat that position (relative to the main Window) after the user drags the Call window to to wherever he wants it. That way the user can position it anywhere docked or not and it will stay at the same relative position until changed by dragging it again. The other option would be to have the ARQ Call menu Item just create a drop down that had two options: “CQ” or a blank place to enter a call sign. That can sometimes be more cumbersome however.

1405. New V4Chat Version 0.4.3.0 Uploaded to FTP

Yahoo group: V4Protocol
Date: 2011-07-29 16:02:28 UTC
From: kn6kb
Topic: 1405 Message: 1405

All,

I have uploaded a new version with some important fixes including the problem with CWID in some configurations.

Uninstall your existing version and re install using the V4ChatSetup in the downloaded zip. No settings will be lost.

If you are new to ARQ please read the V4Chat Help on how to make an ARQ connection. It appears from several posts QSOs I had yesterday that some don't quite understand how ARQ and V4Chat in particular work.

If you are having problems decoding with signals that otherwise appear fairly good try this:
1) Adjust the receive level to the middle of the green
2) Play with the threshold Generally 3-7 default is 5.
3) Try with the bandpass filter in or out.
4) Make sure the signal is fairly close to the red center line.

At this stage it is VERY important to send the V4TNC debug log along with some indication of when (UTC) the problem was observed. I need the details in that log to make any changes. Send the logs as attachments directly to me.

73 and good luck,

Rick Muething, KN6KB

Jack,
That is actually a very good question. What I believe is the setup.exe just looks for the MSI and runs it. I know I can usually just send the msi file (without the setup) and it will install unless you don't have the correct version of Setup.exe in your OS (unlikely). So maybe one of the MS Setup guru's have a better explanation?...I am copying Peter from development team who might know!

1410. RE: [V4Protocol] New V4Chat Version 0.4.3.0 Uploaded to FTP

Yahoo group: V4Protocol
Date: 2011-07-30 00:44:03 UTC
From: Charles Blackburn
Topic: 1405 Message: 1410

MSI files are database files, used by Windows Installer. They contain information about an application which is devided into features and components, and every component may hold files, registry data, shortcuts etc. The MSI file also contains the UI that is to be used for installing, and various other data such as any prerequisites to look for, custom actions to execute, the order of the installation procedure, whether to support Administrative installations, etc. It can also contain the actual files to be installed themselves (this isn't always the case though, the files can also be in an external CAB file or just as plain uncompressed files in a location where MSI can find them).
MSI files are the current recommended way of doing installations on Windows. The alternative is writing a program that performs the installation itself.
MSI files are executed by an EXE file that is part of Windows, called MSIEXEC.EXE. This application reads the data in the MSI file and executes the installation.

Windows Installer is pretty new, especially the newest version (3.0). Often installations that use MSI still come with an EXE (e.g. SETUP.EXE). This EXE is a so-called 'bootstrapper'. It doesn't perform the installation, it simply checks if the correct version of Windows Installer is present on the system, if not it launched the MSI Redistributable (MsiInstA.exe or MsiInstW.exe depending on the platform) and then launches MSIEXEC.EXE on the MSI file. In certain cases (especially Internet downloads), the MSI file and MSI redistributable are packed inside that EXE file, so you don't see they're there.
So installations can come in three flavours:
1. A custom, third-party installation system in an EXE file.
2. A Windows Installer installation in an MSI file.
3. An EXE file that bootstraps an MSI file (that may be embedded inside the EXE file).
MSI files can only be installations. EXE files can be literally anything that can run on your computer.

Subject: RE: [V4Protocol] New V4Chat Version 0.4.3.0 Uploaded to FTP

MSI files are database files, used by Windows Installer. They contain information about an application which is devided into features and components, and every component may hold files, registry data, shortcuts etc. The MSI file also contains the UI that is to be used for installing, and various other data such as any prerequisites to look for, custom actions to execute, the order of the installation procedure, whether to support Administrative installations, etc. It can also contain the actual files to be installed themselves (this isn't always the case though, the files can also be in an external CAB file or just as plain uncompressed files in a location where MSI can find them).
MSI files are the current recommended way of doing installations on Windows. The alternative is writing a program that performs the installation itself.
MSI files are executed by an EXE file that is part of Windows, called MSIEXEC.EXE. This application reads the data in the MSI file and executes the installation.

Windows Installer is pretty new, especially the newest version (3.0). Often installations that use MSI still come with an EXE (e.g. SETUP.EXE). This EXE is a so-called 'bootstrapper'. It doesn't perform the installation, it simply checks if the correct version of Windows Installer is present on the system, if not it launched the MSI Redistributable (MsiInstA.exe or MsiInstW.exe depending on the platform) and then launches MSIEXEC.EXE on the MSI file. In certain cases (especially Internet downloads), the MSI file and MSI redistributable are packed inside that EXE file, so you don't see they're there.
So installations can come in three flavours:
1. A custom, third-party installation system in an EXE file.
2. A Windows Installer installation in an MSI file.

3. An EXE file that bootstraps an MSI file (that may be embedded inside the EXE file). MSI files can only be installations. EXE files can be literally anything that can run on your computer.

1425. Confirmation of sent data

Yahoo group: V4Protocol
Date: 2011-07-31 00:15:36 UTC
From: Rick Muething
Topic: 1415 Message: 1425

All,

There still appears to be much misunderstanding about when data is flowing. All the information is there:

If you are the ISS (the station currently sending data)
1) The V4TNC form show ISS in a red label just above the Xmit Frame label
2) The size in bytes of you Outbound Queue is shown on the upper right corner of the V4 TNC form
3) As the Other side (the IRS) ACKs your can be assured they have received and displayed the data AND your OB queue number will decrement down toward 0. When it reaches 0 all the data that was entered has been sent, was received and is confirmed

If you are the IRS station (the station currently receiving data)
1) The V4TNC form shows IRS in a green label just above the Xmit Frame label.
2) When data is received and decoded correctly it is immediately passed to the V4 Chat session window (bold black text) and an ACK is sent to the ISS.
3) As the IRS your outbound queue is also shown on the upper right of the V4TNC but it will NOT decrement until you become the ISS. That happens automatically When:
a) The ISS has FINISHED sending (his queue is 0) and he signals this by sending IDLs instead of Data
AND
b) The IRS has data pending outbound queue>0.

Understanding this is essential to making it work...It’s the same way Pactor and many other ARQ modes work.

1426. VK3DPW looking for contacts

Yahoo group: V4Protocol
Date: 2011-07-31 00:58:58 UTC
From: Paul Whitaker
Topic: 1415 Message: 1426

Hi Rick & Group,
Looks like the 0.4.3.0 version has the CW ID working now for me.
Looking for contacts - Will be monitoring 14073, 7037.8, and for the more local, 3635, at appropriate times of day.

20mx to the States seems to be good from 0400 hours GMT, so will at least have the station running on ARQ if Im not presently in the shack.
Feel free to call me to try for a connect.

V4Chat looking good.....

1438. K3UK Digi Sked Page

Yahoo group: V4Protocol
Date: 2011-07-31 03:19:26 UTC
From: captcurt@flash.net
Topic: 1438 Message: 1438

FWIW..

the K3UK Sked page has a section dedicated to Digi.

It is a great real-time chat tool for tools like V4. Several of us check it regularly and V4 users already there.

IMHO, it is a much better venue than this to find someone active and where. Its just faster and easier to see all stations.

1439. Latest Obs, V4.3.0

Yahoo group: V4Protocol
Date: 2011-07-31 08:33:54 UTC
From: John, VK5PO
Topic: 1415 Message: 1439

Conducting further test this afternoon on 40m
proved to be an almost non event.

Myself and Paul (VK3DPW) played around for
an hour or more, but only a few lines of text
were exchanged.

For keybord to keyboard qso's Winmor kills
V4. Needless to say, winmor has a wider
bandwidth than v4,

and data speeds ramp up quite nicely.

We acheived speeds up to 5.7kb per
minute....testing by dumping several text
files. Its incredible.!!!!

Without dumping a tub of water on V4 chat, it
has a long way to go before it could be
considered reliable.

I hear you all ask... How do you do keyboard
to keyboard qso's with winmor...

Ask, and I shall tell...
Email me direct.

1440. Re: [V4Protocol] Latest Obs, V4.3.0

Yahoo group: V4Protocol
Date: 2011-07-31 11:23:43 UTC
From: Rick Muething
Topic: 1415 Message: 1440

John,
I would very much like to see your debug logs of V4 (V4 TNC debug). and if possible your WINMOR TNC debug logs near the same time.

Some points in your comparisons of V4 and WINMOR

1) WINMOR is quite a bit more mature than V4 (I should know, I wrote both protocols). WINMOR is now going on 4 years old.
2) I know the coding used and theory well for both WINMOR and V4 and V4 should be more robust once debugged. Why?
WINMOR uses 94 baud vs 47 baud.... That is faster of course but half the energy per bit which is a lot in terms of affecting the Bit Error Rate.
WINMOR does not use Viterbi encoding with interleaving on 4FSK.... Only RS FEC. That is more susceptible to burst errors.
WINMOR takes up more than twice the bandwidth (higher speed of course) but also < half the signal to noise (same power...twice the noise bandwidth)
3) WINMOR is optimized for sending binary data (e.g. files and attachments) and has a much higher latency (less “slick”) so it is not as convenient in a back-and-forth keyboard type connection.
4) The concept behind V4 was make a protocol as robust as possible that fits into 200 Hz and runs fast enough to keep up with a fairly good typist (about 40-50 WPM).

Perhaps its time to re think both again and perhaps put a mode into WINMOR that better fits keyboarding. One thing that would be certain. It would give me a lot more time to concentrate on the effort!

Please send me the debug logs if you have them. They tell far more than an email could on what is really happening inside the protocols.

73,
Rick Muething, KN6KB

1442. Debug Logs?

Yahoo group: V4Protocol
Date: 2011-07-31 13:39:09 UTC
From: Curt Nixon
Topic: 1415 Message: 1442

Hi Rick and all:

Where would you like us to send debug logs? To You direct? or here?

NY3J and I, (KU8L) tried several attempts this AM and the pair of logs might help. What we observed was this.

1. Kind of shaky connects but a couple of successful connections established but dropped out while trying to send info. 20M and I suspect that the conditions were not so good.

2. Moved to 40M and got nearly instant connects a couple of times. But while it looked like data was transferring, the process stopped part way thru and then ISS timed out while sending repeats.

From Ron NY3J end, he observed apparently that his system was trying to send while I was sending. Ths sounds like a QSB or signal condition problem to me but perhaps you could confirm what was happening by seeing both logs.?

I am trying to recruit a local to try this all out at solid NVIS-type conditions. both 40 and 20 here have been less than ideal lately.

THanks

Curt

Curt,

Thanks for the test on V4Chat. I was sending you acks while you were transmitting until I timed out and you kept trying to send. Rick, I guess this is normal under ARQ mode but Curt probably wasn't copying my acks.

I don't have enough experience to know if this is normal operation.

From: Rick Muething
Topic: 1415 Message: 1444

Ron,

As I have said many times before and is in the Help....Send logs directly to me as attachments.

Your word description doesn't tell me much. Was the ISS really sending you data or IDLs? If data and his timeout is anything reasonable (say 60 or more seconds) it is unlikely it will time out. Remember a connect request frame is DATA ...its just formatted in a particular way to cram in both call signs into 16 characters. If you can CONNECT you have already sent one data frame and that had to be ACKed in less than 30 seconds.

If the other side was sending IDLs it was because nothing was in their outbound queue (Did they type anything after connecting? Did they transfer the typed data to the outbound queue with a <Ctrl> Cr? If not the ISS will keep repeating IDLs until it times out. I don't know how to fix that...maybe just make up some text and send the first few lines of the Tale of Two Cities???

The logs tell me all ...even the quality of the decode. Without them debugging or improving is almost impossible.

Rick KN6KB

FWIW..

the K3UK Sked page has a section dedicated to Digi.

It is a great real-time chat tool for tools like V4. Several of us check it regularly and V4 users already there.

IMHO, it is a much better venue than this to find someone active and where. Its just faster and easier to see all stations.

Ed,
Log in with your callsign, no password needed. Then click JT65 -digi,
it's a combined page. On the bottom is the field, in white, where you
can post messages to the group. After you enter your text click post.

If you want to you can click profile to update your qth.

Hi Ed:

If you get to the main page thru the link, there should be a set of colored bars on the right frame of the page. If you dont see the colored selection bars for JT65-Digi, LOTW, SKCC, MARS, etc, then click "Fix Frames" in the middle of the top of the window..that should get you to see JT65-Digi bar. click and you are in the digi sked/chat area. I think you have to sign in to post but it is simple and secure. I have never had any security issues from the page in 3 or more years of use. It really is a great tool.

Hi OM. Good loud signal on 40M but having problem decoding.

It sounds like your setup is clipping off part of the ack and also clipping the Morse ID. When I can decode the CQ, it wont ever complete a transfer because I never get a good ack during my transmissions.

You might try backing off on the drive to the rig and soundcard output levels to see if that helps. Also be sure to check the latency testing as described in the help files.

Just a thought..you're close..

Hi Curt and thanks for hanging around. FEC was lots easier than vv4 chat. Here where the entire problem might lay. I'm using a RigBlaster Plus. It has never let me down on anyother digital modes, so I keep asking why here? I know this much in the other modes I was always able to adjust the soundcard to remove all of the alc but inturn lowered the power. In v4 chat this is not happening. Any ideas will always be accepted. 73 Ed WD9DVA, Greenwood, In

Hi Ed:

I'm not really familiar with the Rigblaster as I use a homebrew isolated transformer interface between my various rigs and the PC. Perhaps the output settings in the PC are overwhelming the rigblaster. Open the volume controls in the PC and try to reduce them?.

Other than that, perhaps someone that uses the RB+ will help.

In previous QSO's here, I could always hear the bird chirp ACK. (DOO-WEE) between my frames. In your case, I only hear the WEE part and so my transmissions just repeat looking for the ack.

Also, I can hear clips on each character during the CW ID.

I think as a measure of drive, you should be able to use the two-tone test in V$ and be able to adjust to 50-80W or so using a normal mike input level if you use mic input (similar with an aux input. It should definitely not be pushing up ALC I would think.

Not sure this helps but a try.

Well that is certainly possible but if the setup works for other modes ok, probably not. Will it work OK at 50-80W with RTTY?

I had some issues with RF..only on 15M, added a line choke to the coax feedline, made sure the PC was grounded, and I have ferrite chokes at the mike input and the PC soundcard inputs.

Did you do the two tone T-R latency test?

Curt
